**PREFACE**

The Nepal Living Standards Survey IV (NLSS-IV) 2022-23 (2022 July to 2023 June) is the fourth iteration of this survey conducted by the National Statistics Office (NSO). The previous three rounds were carried out in 1995-96, 2003-04, and 2010-11. All four rounds of this survey have followed the methodology developed by the Living Standards Measurement Survey (LSMS) developed by The World Bank.

Building upon the legacy of previous rounds, this comprehensive survey provides detailed and updated snapshots of living conditions of Nepali households using robust methodologies. A key highlight of this report is its detailed analysis of consumption-based poverty, which was published by the NSO on February 12, 2024.

The present survey has been conducted for the first time after the restructuring of the country into a federal democratic republic system. Most statistical tables in this detailed statistical report are presented by seven provinces, urban/rural, consumption quintile and poverty status (poor/non-poor). This edition of the NLSS carries particular significance as it captures the socioeconomic landscape of Nepal in the wake of the COVID-19 pandemic and amidst evolving global challenges.

The report explores several crucial themes, including demographics; education; health; employment; household's access to services such as water, sanitation, electricity, and healthcare; agriculture; food security; land ownership; crop production; and food consumption patterns. It also covers access to financial services and savings, coverage and effectiveness of social assistance programs, and income and consumption expenditure details of the households.

I acknowledge the dedication and hard work of the team involved in designing, implementing, analyzing, and presenting the report to this form. I am also grateful to households who generously participated in this survey, providing us with invaluable data. I am confident that this report will serve as an essential tool for informed decision-making and contribute significantly to our collective journey towards a more prosperous and equitable Nepal.

The findings of this report will help to guide policymakers, researchers, development partners, and all stakeholders invested in improving the lives of the Nepali people through evidence-based policy action. Finally, I request all the users to fully utilize these resources to carry out further analysis and provide us with valuable insights and suggestions to maximize the use of the data and its findings.

  
Arjun Prasad Pokharel  
Chief Statistician

June 2024

# TABLE OF CONTENT

<b>Executive Summary</b>	<b>1</b>
<b>CHAPTER 1: INTRODUCTION</b>	<b>11</b>
1.1 Introduction	11
1.2 Objective of the survey	11
1.3 Scope	11
1.4 Poverty estimation using NLSS-IV	12
<b>CHAPTER 2: METHODOLOGY</b>	<b>13</b>
2.1 Statistical Unit	13
2.2. Coverage	13
2.3 Time reference	13
2.4 Survey methodology	13
2.5 Sampling design	13
2.6 Questionnaire Design	15
2.7 Field Work Organization	17
2.7.1 Field teams	17
2.7.2 Field staff recruitment and training	17
2.7.3 Data Collection and Supervision	17
2.7.4 Data Entry and Management	17
2.7.5 Organization of the report	18
<b>CHAPTER 3: DEMOGRAPHIC CHARACTERISTICS</b>	<b>19</b>
3.1 Introduction	19
3.2 Distribution of population by age and sex	19
3.3. Dependency ratio	20
3.4 Household size and distribution by size	21
3.5 Sex and age of household head	21
<b>CHAPTER 4 :HOUSING</b>	<b>37</b>
4.1 Introduction	37
4.2 Occupancy status	37
4.3. Construction material of outer walls	38
4.4 Materials for roofing	38
4.5 Materials for foundation	38
4.6 Materials for floors	39
4.7 Number of rooms, area of dwelling and housing plot	39

4.8 Access to drinking water and various amenities	39
4.9 Main fuel used for cooking	40
4.10 Firewood collection and used	41
4.11 Places of firewood collection	41
4.12 Stove used for cooking	42
<b>CHAPTER 5: ACCESS TO FACILITIES</b>	<b>61</b>
5.1 Introduction	61
5.2 Education	61
5.3 Health	62
5.4 Road transport	62
5.5 Market Centre	63
5.6 Agricultural and animal service/vet centre	63
5.7 Cooperatives and bank	64
5.8 Source of drinking water, police station, ward office, and community library	64
<b>CHAPTER 6: LITERACY AND EDUCATION</b>	<b>93</b>
6.1 Introduction	93
6.2 Literacy Rates	93
6.3 Educational Status	94
6.4 Net Enrollment Rate	94
6.5 Gross Enrollment Rate	95
6.6 Mean Years of Schooling	95
6.7 Type of School Attended	95
6.8 Reasons for Dropout	96
6.9 Educational Expenses	97
<b>CHAPTER 7: HEALTH SERVICES</b>	<b>117</b>
7.1 Introduction	117
7.2 Non Communicable Diseases	117
7.3 Communicable Diseases	117
7.4 Health consultations with medical practitioners	118
7.5 Health consultations by facility type (government and private)	118
7.6 Health expenditure and source of funds	119
7.7 Disability	119
<b>CHAPTER 8: MIGRATION</b>	<b>137</b>
8.1 Introduction	137
8.2 Status of migrants	137

8.3 Origin of migration: first out-migration from birthplace	138
8.4 Reason for migration: first out-migration from birthplace	138
8.5 Distribution of destination: from first out-migration from the birthplace	139
8.6 Ratio of in-migrant population to total population by sex	139
8.7 Origin of migration: last place before in-migration to current place	139
8.8 Age of in-migrants and duration of living among in-migrants	139
8.9 Reason for migration - in-migration to current place	140

## **CHAPTER 9: ABSENTEES** **149**

9.1 Introduction	149
9.2 Absentees as a proportion of the total population	149
9.3 Absentees by place of current residence	150
9.4 Absentees by reason	150

## **CHAPTER 10: AGRICULTURE** **155**

10.1 Introduction	155
10.2 Characteristics of Agriculture Household Head	156
10.3 Distribution of Agriculture Household (Holding)	156
10.4 Land Ownership	157
10.5 Land Fragmentation and Farm Size	157
10.6 Land Tenure	158
10.7 Major Crops	159
10.8 Improved Seeds	159
10.9 Use of Fertiliser	159
10.10 Livestock and Poultry	160

## **CHAPTER 11: CONSUMPTION** **185**

11.1 Introduction	185
11.2 Consumption aggregate	185
11.2.1 Food consumption expenditure	185
11.2.2 Non-food consumption expenditure	186
11.2.3 Non-food non-durable items	186
11.2.4 Durable items	186
11.2.5 Housing	187
11.3 Distribution of nominal per capita consumption	188
11.4 Distribution of nominal household consumption	189

## **CHAPTER 12: INCOME** **197**

12.1 Introduction	197
12.2 Construction of Income Aggregate	197

12.2.1 Farm Income	198
12.2.2 Wage Income	199
12.2.3 Non-farm Enterprises Income	200
12.2.4 Non-agricultural Rental Income	200
12.2.5 Transfer Income	200
12.2.6 Value of Owner-occupied Housing	200
12.2.7 Other Income	200
12.2.8 Total Income	201
12.2.9 Items Omitted from Income Aggregate	201
12.3 Levels, Sources and Distribution of Income	201
12.3.1 Levels of income	201
12.3.2 Income sources	202
12.3.3 Distribution of income	202

## **CHAPTER 13: LABOUR AND EMPLOYMENT** **211**

13.1 Introduction	211
13.2 Key labour market concepts	211
13.3 Labour market indicators by provinces and poverty status	213
13.4 Sex and labour market outcomes	213
13.5 Rural-urban differences in labour market outcomes	213
13.6 Labour market indicators by consumption quintiles	214
13.7 Age and labour market outcomes	214
13.8 Education and labour market outcomes	214
13.9 Sectors of employment	215

## **CHAPTER 14: WAGE EMPLOYMENT** **251**

14.1 Introduction	251
14.2 Number of days worked, remuneration, and basis of wage payment	251
14.3 Working patterns and earnings by occupation groups	252
14.4 Working patterns and earnings by rural-urban areas/analytical domains	253

## **CHAPTER 15: NON-FARM ENTERPRISES** **259**

15.1 Introduction	259
15.2 Distribution of non-farmenterprise by industry	259
15.3 Ownership, registration, and hired labour	259
15.4 Size of hired workers	259
15.5 Financial Performance	260
15.6 Operational Tenure	260

<b>CHAPTER 16: REMITTANCE AND TRANSFER INCOME</b>	<b>269</b>
16.1 Introduction	269
16.2 Remittance received by households	269
16.3 Remittance source (in and outside the country)	270
16.4 Means of Transferring Remittance	270
16.5 Use of Remittance Received	270
<b>CHAPTER 17: HOUSEHOLD LOANS</b>	<b>281</b>
17.1 Introduction	281
17.2 Households with loans	281
17.3 Source of loan	281
17.4 Years of borrowing	282
17.5 Purpose of loan	282
17.6 Collateral for loan	282
17.7 Average amount of loan per household and outstanding loan	282
<b>CHAPTER 18: ADEQUACY OF CONSUMPTION</b>	<b>291</b>
18.1 Introduction	291
18.1 Adequacy of consumption	291
<b>CHAPTER 19: GOVERNMENT AND PRIVATE FACILITIES</b>	<b>297</b>
19.1 Introduction	297
19.2 Government and Private facilities status	297
<b>CHAPTER 20: SECURITY</b>	<b>319</b>
20.1 Introduction	319
20.2 Security Situation	319
<b>ANNEX</b>	<b>323</b>

# EXECUTIVE SUMMARY

## 1. Introduction:

The Nepal Living Standards Survey IV (NLSS-IV), conducted in 2022/23, is the first living standards survey since the country's transition to a federal system. This survey collected data from a nationally representative sample of 9,600 households on a wide range of topics related to household welfare, including consumption, housing, access to facilities, education, health, labour, agriculture, income, migration, wage and employment, household loans, remittance, adequacy of government and private facilities, and security. The survey is also representative at the province level, urban-rural level across the seven provinces, and Kathmandu Valley urban separately. The survey aims to provide a comprehensive picture of living standards in Nepal and inform government programs aimed at poverty reduction and achieving the Sustainable Development Goals (SDGs). The NLSS-IV utilised an updated methodology while ensuring as much continuity as possible with the previous rounds and aligning with international best practices and the country's changing realities.

## 2. Methodology:

The survey utilizes the standard definition of a household and employs a two-stage stratified sampling strategy to ensure a sample that is nationally representative and representative across 15 analytical domains (urban and rural areas in the seven provinces and Kathmandu Valley urban). The questionnaire has been updated to reflect contemporary issues and consumption patterns, with a particular focus on capturing information on food consumption, non-food expenditures, and durable goods. The data collection process involved extensive training for field staff and real-time data monitoring to ensure accuracy and quality control.

## 3. Demography:

Nepal has undergone significant demographic transformations between 1995/96 and 2022/23, as indicated by the Nepal Living Standards Surveys. The population structure has shifted towards a younger working-age population, with a decrease in the proportion of children (0-14 years) and an increase in the proportion of adults (15-59 years). This trend is further supported by a declining dependency ratio, suggesting a growing workforce. The proportion of the elderly population (60 years and above) has increased. The sex ratio had been declining until 2010/11 but has slightly increased between 2010/11 and the most recent survey round of 2022/23.

Household size has also decreased, likely driven by urbanization and changing family structures. Notably, the percentage of female-headed households has increased substantially, rising from 13.6 percent in 1995/96 to 37.1 percent in 2022/23.

## 4. Housing:

House ownership has been declining over the years, mostly absorbed by the increase in rental housing. This shows the change in people's living patterns. Overall, significant improvements in housing quality, access to utilities, and sanitation are seen over the surveyed period, reflected in the use of more durable construction materials. However, there are also differences based on economic status and urban and rural areas.

## 5. Access to Facilities:

There has been progress in access to essential services for households between 1995/96 and 2022/23, particularly when looking at reach within a 30-minutes. There has been a notable increase in the percentage of households within reach of schools and educational institutions, although access decreases with an increase in educational level. Similarly, access to healthcare has improved, with more households residing near health posts, sub-health posts, clinics, and private hospitals. Access to paved road facility substantially increased from 24.7 percent in 1995/96 to 80.0 percent in 2022/23. Other notable areas of improvement include access to market Centre (28 percentage points jump), agricultural centre (32 percentage points jump), and cooperatives and banking (29 percentage points and 34 percentage points jump respectively) between the last survey round in 2010/11 and 2022/23.

## 6. Education:

The literacy rate for the population aged 15 years and above has shown a substantial increase from (35.6 percent in 1995/96 to 72.5 percent in 2022/23). This improvement is more noticeable among males, in the same age group with the literacy rate increasing from 53.5 percent in 1995/96 to 82.9 percent in 2022/23, compared to females, where the increase is from 19.4 percent in 1995/96 to 64.1 percent in 2022/23.

The data also shows a significant increase in school attendance among the population aged 15 years and above (33.9 percent having attended school in 1995/96 compared to 70.2 percent in 2022/23). This trend is again more noticeable among males, with school attendance increasing from (50.2 percent in 1995/96 to 81.4 percent in 2022/23) compared to females, whose attendance increased from (19.1 percent in 1995/96 to 61.1 percent in 2022/23). Net enrollment rates at different levels of education showcase a mixed picture.

## 7. Health:

The survey data on health services reveals a mixed picture of health status and access to healthcare in Nepal between 1995/96 and 2022/23. There has been an increase in the percentage of the population reporting non-communicable diseases from 6.5 percent in 1995/96 to 18.5 percent in 2022/23, indicating a potential rise in non-communicable diseases). There has also been a notable increase in the percentage

reporting communicable diseases from 9.0 percent in 1995/96 to 24.9 percent in 2022/23, suggesting a potential shift in disease patterns or reporting practices.

Looking at the types of communicable diseases, a decline is observed in diarrhoea from 15.5 percent in 2010/11 to 6.6 percent in 2022/23, potentially indicating improved sanitation and hygiene practices, while cold/fever remains a significant concern, with an increase from 30.6 percent in 2010/11 to 51.5 percent in 2022/23. Percentage of those consulting a doctor has remained relatively stable (around 29 percent). The percentage consulting a paramedic has significantly decreased.

## 8. Migration:

Migration patterns within Nepal reveal significant shifts in migration trends between 2003/04 and 2022/2. While the overall percentage of the migrant population within country has remained relatively stable, with (36.6 percent in 2003/04 and 38.1 percent in 2022/23), a notable shift is observed in the gender composition of migrants. Males constituted a higher proportion of migrants in 2003/04 (50.1 percent) but females make a larger share of the migrant population (49.6 percent) in 2022/23.

A decline in the percentage of migrants from rural areas in 2022/23 indicates a potential shift in migration patterns, possibly driven by changing economic opportunities and societal factors. The analysis of reasons for migration reveals that family remains the dominant factor (75.2 percent in 2003/04 moving within country for family reasons and 74.9 percent in 2022/23).

## 9. Absentees:

The survey data on absentees reveals a decrease in the overall percentage of absentees (20.3 percent of the population were absent in 2010/11, compared to 16.9 percent in 2022/23). Furthermore, a noticeable gender difference is observed, with males having a significantly higher percentage of absenteeism compared to females (29.8 percent vs. 10.9 percent in 2010/11 and 24.1 percent vs. 9.3 percent in 2022/23). The module on absenteeism captures family members residing outside the country as well for work or personal reasons.

A large percentage of absentees are individuals aged 15 years and above. The data on the location of absentees show a decrease in the proportion of absentees residing within Nepal from 2010/11. Conversely, the percentage of absentees residing outside Nepal has increased from 43.1 percent in 2010/11 to 51.6 percent in 2022/23.

## 10. Agriculture:

This survey data on agricultural indicators reveals significant changes in the agricultural sector between 1995/96 and 2022/23. The proportion of agricultural households with land has steadily decreased, from 83.1 percent in 1995/96 to 60.3 percent in 2022/23. This decline in land ownership is further reflected in

the shrinking average size of agricultural land holdings, which has reduced from 1.1 hectares in 1995/96 to 0.4 in 2022/23. Percentage of irrigated land area has fluctuated slightly since 1995/96 reaching 49.4 percent in 2022/23.

Furthermore, a significant increase in the percentage of holdings operating with rented-in land is observed, from 4.8 percent in 1995/96 to 18.4 percent in 2022/23.

The survey also shows a shift in cropping patterns - the percentage of holdings growing main paddy has decreased from 76.0 percent in 1995/96 to 64.3 percent in 2022/23 and the percentage of holdings growing summer vegetables has increased from 35.6 percent in 1995/96 to 39.3 percent in 2022/23. Lastly, the percentage of holdings with cattle has declined significantly from 73.5 percent in 1995/96 to 37.8 percent in 2022/23.

## **11. Consumption:**

Annual nominal per capita consumption has increased drastically between 1995/96 and 2022/23 (Rs. 6,802 in 1995/96 to Rs. 130,853 in 2022/23), indicating improvements in living standards. However, the data also highlights persistent income inequality, with a notable difference in consumption levels between the poorest and richest 20 percent of the population. In 2022/23, the richest 20 percent had an annual nominal per capita consumption of Rs. 254,806, while the poorest 20 percent had annual nominal per capita consumption of Rs. 57,855.

## **12. Income:**

Over the period from 1995/96 to 2022/23, Nepal has seen substantial growth in nominal income levels. The annual average household income increased more than twelvefold, from NRs. 43,732 in 1995/96 to NRs. 551,148 in 2022/23. Similarly, the average per capita income rose significantly from NRs. 7,690 to NRs. 136,707 over the same period. This growth was uneven across income groups: the per capita income of the poorest 20% of the population grew from NRs. 2,020 to NRs. 61,335, while that of the richest 20% surged from NRs. 19,325 to NRs. 259,867. The composition of household income also shifted markedly, with the share of farm income dropping from 61% in 1995/96 to 16.8% in 2022/23, reflecting a transition towards non-farm and other income sources. Remittances make up important share of this income.

## **13 Labour:**

The survey data on employment status reveals significant shifts in the labour market between 1995/96 and 2022/23. The percentage of employed population is 32.4 percent in 2022/23 while the percentage of those not in the labour force is 62.9 percent. The unemployment rate is 12.6 percent in 2022/23. It is more pronounced among younger workers, with the unemployment rate for those aged 15-24 years is 22.7 percent in 2022/23. This highlights the challenge of finding employment for youth in Nepal.

The share of wage employment in agriculture has significantly decreased from (70.7 percent in 1995/96 to 1.9 percent in 2022/23). The share of wage employment in non-agriculture, on the other hand, has risen considerably from (9.5 percent in 1995/96 to 56.6 percent in 2022/23).

#### **14. Wage Employment:**

Data on wage employment in 2022/23 provides insights into the nature of work and earnings in Nepal. The annual average number of daily working days for wage earners in 2022/23 is 72. The mean daily wage in cash is Rs. 599, while the mean daily wage in kind is Rs. 77. Despite the daily work commitment, the mean yearly earnings from daily wages, including both cash and in-kind, is Rs. 54,632, which is significantly lower than the mean yearly earnings from long-term jobs Rs. 290,682 and contractual work Rs. 215,387.

The mode of working conditions further emphasizes the prevalence of daily wage employment, with 64.9 percent of wage earners working daily. This suggests a lack of secure and stable employment opportunities for most of the workforce. While long-term jobs with monthly salaries account for 28.7 percent, contract-based work constitutes only 6.4 percent.

#### **15. Non-Farm Enterprises:**

Non-farm activities reveal a dynamic and evolving landscape of household businesses and enterprises between 1995/96 and 2022/23. The overall percentage of households with enterprises has fluctuated since 1995/96, but between the last round in 2010/11 and the recent round in 2022/23, it has decreased from 34.6 percent to 22 percent.

The data shows a noticeable shift in the dominant sectors of non-farm activities. While trade was previously the most prevalent sector (52.1 percent in 1995/96), it has declined to (42.5 percent in 2022/23). The share of manufacturing has also decreased from 29.9 percent in 1995/96 to 22.6 percent in 2022/23.

The percentage of registered enterprises has increased significantly from 11.7 percent in 1995/96 to 52.6 percent in 2022/23, indicating greater adherence to regulations and potentially better access to resources and support. Similarly, the proportion of enterprises operating for 10 to 12 months has also increased from 54.5 percent in 1995/96 to 78.3 percent in 2022/23. Finally, the data on financial performance reveals a notable increase in gross revenue, gross expenditure, and net revenue.

#### **16. Remittance:**

The survey data on remittances and transfers reveals a significant increase in the prevalence and magnitude of remittances received by households in Nepal between 1995/96 and 2022/23. The percentage of households receiving remittances has increased dramatically from 23.4 percent in 1995/96 to 76.8 percent in 2022/23, indicating a significant rise in the number of households relying on

remittances. This increase is consistent with the observed growth in the average amount of remittances received per household, which has significantly increased from Rs. 15,160 in 1995/96 to Rs. 145,093 in 2022/23.

The data on remittances from within Nepal shows a decline (44.7 percent in 1995/96 to 29.3 in 2022/23). On the other hand, remittances from other countries (other than India) are still quite dominant (49.4 percent in 2022/23), highlighting the importance of international migration for income generation. There has been a decline in remittances from India from 32.9 percent in 1995/96 to 11.1 percent in 2010/11, but they have increased since, reaching 21.3 in 2022/23.

## 17. Household Loans:

The survey data on household loans shows that the percentage of households borrowing loans has remained relatively stable (61.3 percent in 1995/96 and 63.8 percent in 2022/23). However, the percentage of households with outstanding loans has significantly increased, from 58.4 percent in 1995/96 to 97.3 percent in 2022/23. The data also reveals a shift in the sources of household loans, traditional money lenders were previously a dominant source (39.7 percent in 1995/96), but their share has significantly decreased to 11.4 percent in 2022/23. The share of loans from banks has increased from (16.1 percent in 1995/96 to 22.4 percent in 2022/23), while loans from relatives continue to remain significant (40.8 percent in 1995/96 to 42.5 percent in 2022/23).

Household consumption as a reason for borrowing has been declining (49.4 percent in 1995/96, 23.5 percent in 2022/23). This could be attributed to improved access to essential goods and services or a shift towards other borrowing needs. Loans for other personal uses have increased substantially from 21.9 percent in 1995/96 to 55.8 percent in 2022/23. The use of collateral has also shifted, with an increase in the proportion of loans taken with collateral. While 16.8 percent of loans were taken with land/house collateral in 1995/96, this share increased to 35.1 percent in 2022/23. Finally, the average nominal per capita loan has increased dramatically from 2003/04.

## 18. Adequacy of Consumption:

The survey presents the respondents' view on consumption adequacy across various essential categories. It reveals a trend of improvement in consumption adequacy between 1995/96 and 2010/11. The percentage of households reporting "less than adequate" consumption of housing, clothing, healthcare, and schooling has been steadily declining since 1995/96 to 2010/11, but have increase since (except schooling). However, when it comes to the adequacy of total income, 50.5 percent of households report "less than adequate" in 2022/23.

## 19. Government Facility:

The survey also reports people's opinions on a set of important government and private facilities they use on a four-point scale: "Good", "Fair", "Bad", and "Not Applicable". Overall, "Fair" ratings dominate across most facilities including private and public healthcare, schools, drinking water, electricity and roads. Findings suggest a general perception of average quality with some variations across categories.

## 20. Security:

Finally, the perception of respondents on general security was also collected during the survey, along with the incidence of theft, robbery, physical violence, mental violence, and sexual violence in the last 12 months. A majority of the population over "90 percent" feels either "Completely safe" or "Safe," with only a small percentage feeling "Completely insecure." However, there is a gender difference, with females reporting a slightly higher feeling of insecurity compared to males. The data show both males and females report having experienced theft. While the rates of physical violence are relatively low for both genders, the rate of mental violence as self-reported by respondents is slightly higher for women (1.2 percent) compared to males (0.5 percent). The data also highlights the issue of sexual violence, with both males and females reporting this experience. Women are slightly more likely to have experienced at least one type of violence than men.

Thapathali, Kathmandu

# CHAPTER 1: INTRODUCTION

## 1.1 Introduction

The fourth Nepal Living Standards Survey (NLSS-IV) is the first of its kind to measure the “extent and dimensions” of poverty after the reclassification of the administrative and political boundaries in Nepal following the transition into a federal structure since the new constitution was enacted in 2015. The survey contains information on a range of topics related to household welfare from a nationally representative sample of 9,600 households. It is also designed to be representative at the urban-rural level across the seven provinces and Kathmandu Valley urban separately.

**Table 1: Living Standard Surveys in Nepal 1995-2023**

Survey Round	Year (AD)	Year (BS)
NLSS-I	1995/96	2052/53
NLSS-II	2003/04	2060/61
NLSS-III	2010/11	2066/67
NLSS-IV	2022/23	2079/80

## 1.2 Objective of the survey

As with the past rounds, this survey aims to collect data on the living standards of people and to understand household welfare. The survey and its findings provide an objective basis to monitor the key economic and governance reforms on poverty reduction and Nepalis’ well-being in general, including the sustainable development goals.

## 1.3 Scope

The survey collects detailed information on households’ food and non-food consumption expenditures to estimate poverty. Topics include housing, access to facilities, migration, food expenses and home production, non-food expenditure and durable goods, education, health, labour and employment, wage jobs, farming and livestock, non-agriculture enterprises and activities, credit and savings, absentees and remittances, social assistance and other income, public services, and security.

The sampling frame for the survey was devised using the National Population and Housing Census 2021. The survey maps the administrative categorisation of metropolitan cities, sub-metropolitan cities, and municipalities to the category of urban areas and rural municipalities into the rural category. In line with the international best practice, the data collection lasted for a year between July 2022 and

June 2023 to capture seasonal variation in consumption and it used a recall period of 7 days for food consumption, and 30 days and 12 months in the case of non-food consumption expenditures.

## 1.4 Poverty estimation using NLSS-IV

The National Statistics Office (NSO) released a summary report on 12 February 2024 highlighting key statistics from the NLSS-IV<sup>1</sup>, particularly the incidence of poverty at the national and provincial level and measures of inequality, namely, poverty gap, squared poverty gap, and Gini Index. Like in other countries in South Asia, Nepal's poverty line is defined using the Cost of Basic Needs (CBN) approach. The NSO undertook a comprehensive review of the poverty estimation methodology to align with the current international best practices and standards. The technical review was imperative given the long gap from the last round (NLSS-III), the transition to a federal system requiring poverty estimates at the sub-national level, and substantial welfare changes in the country as seen in the survey. This review led to the adoption of a new poverty line with 2022/23 as the base year. The updated line raises the bar for minimum living standards in line with Nepal's aspirations and reality and will form the basis for monitoring national and provincial poverty going forward. Regularly revising the poverty line also demonstrates Nepal's commitment to effective and more inclusive targeting of pro-poor programs with changing realities.

This statistical report briefly describes the methodology and provides a basic descriptive analysis of the NLSS-IV data.

---

1 [https://api.giwms.gov.np/storage/36/posts/1707800524\\_89.pdf](https://api.giwms.gov.np/storage/36/posts/1707800524_89.pdf)

## CHAPTER 2: METHODOLOGY

### 2.1 Statistical Unit

The NLSS-IV follows a conventional two-stage stratified sampling, with the census enumeration areas (EAs) forming the primary sampling units (PSUs) in the first stage and households within the selected EAs forming the secondary sampling units (SSUs) in the second stage. The definition of a household is adopted from the United Nations' "Principles and Recommendations for Population and Housing Censuses, Rev 3" (Department of Economic and Social Affairs Statistics Division, UN, 2017). According to the guideline, the concept of household is based on the "arrangements made by persons, individually or in groups, for providing themselves with food or other essentials for living". A household may consist of one person or a group of two or more people that may pool their incomes, have a common budget, or may be related or unrelated.

Similarly, for the purposes of this survey, a household head is defined as a person who is present in the household and manages household activities.

### 2.2. Coverage

The survey represents the whole country through a nationally representative sample and representative samples across fifteen domains (Strata) – urban and rural areas in the seven provinces and Kathmandu Valley urban separately. All households in the country were considered eligible for selection in the survey with the exclusion of households of diplomatic missions, and institutional households (residential schools, hostels, prisons, army camps and hospitals). Household members were determined based on the usual place of their residence.

### 2.3 Time reference

The survey questions in NLSS-IV refer to the following time periods depending on the question:

- The day of the interview
- Past 7 days from the day of interview
- Past 30 days from the day of interview
- Past 12 months from the day of interview

### 2.4 Survey methodology

All four of Nepal's Living Standards Surveys have been based on The World Bank's Living Standards Measurement Survey (LSMS) methodology. NLSS-IV updates the methodology of the LSMS in line with international best practices.

## 2.5 Sampling design

NLSS-IV uses an updated sampling frame from the Population and Housing Census 2021. It is nationally representative as well as representative for 15 domains (Strata)– urban and rural areas in the seven provinces and Kathmandu Valley urban separately. Unlike NLSS-III, it does not have a panel sample. The sampling strategy followed a conventional two-stage stratified sampling. In the first stage, using the exhaustive list of census enumeration areas (EAs) as primary sampling units (PSUs), 800 EAs were selected from the 15 domains using probability proportional to size (PPS). Detailed household listing was conducted in the selected areas using tablets to update the list of households.

After listing all households in a selected enumeration area, the list was sorted according to the household size (implicit stratification). Twelve households were randomly selected from each EA using all households from the post-listing (sorted list) sampling frame as the secondary sampling units (SSUs), with an equal probability of selection.

Table 2.1 presents the number of selected EAs and the final sample of households across the 15 analytical domains. The sample size in each domain was proportional to the share of households in the 2021 Population Census.

**Table 2.1: Number of EAs and households by domain/strata**

<b>Domain</b>	<b>Number of EAs</b>	<b>Number of surveyed households</b>
Koshi Urban	64	768
Koshi Rural	54	648
Madhesh Urban	65	780
Madhesh Rural	51	612
Kathmandu Valley urban	64	768
Bagmati Urban (excluding KTM Valley)	55	660
Bagmati Rural	50	600
Gandaki Urban	56	672
Gandaki Rural	44	528
Lumbini Urban	62	744
Lumbini Rural	56	672
Karnali Urban	43	516
Karnali Rural	41	492
Sudurpaschim Urban	52	624
Sudurpaschim Rural	43	516
<b>Total</b>	<b>800</b>	<b>9600</b>

## 2.6 Questionnaire Design

The NLSS-IV questionnaire is similar in design to the NLSS-III household questionnaire. Unlike in the previous rounds, the community questionnaire was dropped from the NLSS-IV. The survey adopted the NLSS-III instrument with important additions and modifications to fit the current context. Sections on marriage and maternity history, anthropometry and breastfeeding that were featured in the last round were discontinued in this round.

Considering the changed patterns of consumption between 2011 and 2023, the survey added new food items, a disaggregated items list of non-food non-durable goods, and an updated list of durable items that are relevant for households' welfare today. The NLSS-IV, thus, elicits household consumption and expenditure information on the items beyond those covered in the NLSS-III.

The NLSS-IV used the same recall period as introduced in NLSS-III for food consumption but added an innovation to capture information on meals consumed outside the home for every household member separately.

The questionnaire was field tested multiple times, and the questionnaire was finalised after the approval from technical and steering committees of the NLSS IV.

Table 2.2 presents the topics covered in NLSS-IV.

**Table 2.2: Contents of the NLSS-IV questionnaire**

<b>Sections</b>	<b>Details</b>
Cover page	Household ID, name and address of the household head, GPS coordinates of the location, and certification of enumerator and supervisor
Survey information	Enumeration details (date of interview and replacement details and certification of supervisor); household information; data entry details (date of data entry and certification by supervisor).
Household Roster	"Demographic characteristics (including name, sex, age, relationship to the household head, birthplace, marital status for persons aged 10 years or over, and caste/ethnicity), and identification of household members, and parents of household members (whether living in the same household and educational status)"
Housing	Part A: Type of dwelling, Part B: Housing expenses, Part C: Utilities and amenities;
Access to facilities	Distance to the various (234) public facilities and services, mode of transport and travel time required to reach the facility and if a household member had used the facility in the last 12 months.
Migration	For all household members - first out-migration from birthplace (if different), last in-migration to this place, time since in-migration to this place

<b>Sections</b>	<b>Details</b>
Food expenses and home production	Part A: Food at home - consumption of foods (during past 7 days from the day of enumeration)- home production, food purchased, and food received in kind; Part B: Food away from home within country - (during past 7 days)
Non-food expenditures and inventory of durable goods	Part A: Non-food expenditures (during past 30 days and 12 months) Part B: Expenditure abroad (during past 12 months) Part C: Inventory of durable goods; Part D: Own account consumption of goods
Education	Part A: Literacy - Literacy status, level of education, enrollment.; Part B: Expenses on education (past 12 months)
Health	All household members. Part A: Non-communicable diseases - including expenses in the last 12 months; Part B: Communicable diseases or injuries - including expenses in the last 12 months; Part C: Disability; Part D: Mortality
Labour and employment	For all household members 10 years and older - paid work in the last 7 days, type and places of employment; looking for work or starting own business in the last 30 days
Wage jobs	"Wage jobs in the last 12 months and wage paid, long term or contract basis"
Farming and livestock	PART A1: Land holding-land owned; PART A2: Landholding - land sharecropped/rented/ mortgaged -in; PART A3: Landholding - increase-decrease in holdings; Part B: Production and uses; Part C1: Expenditures on seeds and young plants; Part C2: Expenditures on fertilizers and insecticides; Part C3: Expenditures on hiring labour; Part D: Agriculture-earnings/ expenditures; Part E: Livestock - ownership, income and expenses; Part F: Ownership of farming assets and extension services
Non-Agriculture enterprises/activities	Part A: General characteristics (last12 months); Part B: Income from enterprises (last 12 months);
Credit and saving	Part A: Borrowing and outstanding loans (last 12 months); Part B: Lending and outstanding loans; Part C: Other assets
Absentees information	Part A: General information on absentees; Part B: Employment and remittances from absentees
Other remittances	Part A: Remittances and transfer-income sent (last 12 months); Part B: Remittances and transfer-income received
Transfers, social assistance and other income	Part A: Transfers Part B: Social assistance; Part C: Other income in last 12 months
Adequacy of consumption	Part A: Adequacy of consumption and public services; Part B: Food insecurity experience scale
Security	For individuals 10 years and above - feeling safe, cash or goods stolen, being looted or violence experienced in the last 12 months,

## 2.7 Field Work Organization

### 2.7.1 Field teams

The data for NLSS-IV was collected over 12 months between July 2022 and June 2023. The fieldwork was planned in a way that would yield a representative sample across the three seasons – dry, rainy, and winter – in Nepal.

NSO mobilised 25 teams across the country and were based out of the NSO's offices across the country to cover all sampled areas. Each team was composed of one supervisor, three interviewers, and one data entry operator, and on average, collected data from 36 sampled EAs. Each team had a laptop, tablet, GPS and other equipment needed for the survey. Undertaking field interviews on paper-based questionnaires and entering the data into tablets/computers at the end of each day contributed to maintaining the quality and timeliness of data entry. Besides the built-in checks in the data entry program, Computer Assisted Personal Interviews (CAPI), team supervisors serve as the first checkpoints for quality control. The supervisors were responsible for coordinating, supervising, and monitoring the fieldwork of their teams, including checking the filled-in questionnaires doing real-time corrections, and supervising data entry activities. The primary job of the interviewers was to conduct the pen-and-paper personal interviews (PAPI), while the data entry operators were responsible for entering the information into the computer while on the field.

### 2.7.2 Field staff recruitment and training

A total of 125 field workers were recruited for 13 months accounting for their training time. They were selected from a nationwide competition and were trained for 28 days before deploying in the survey operation.

### 2.7.3 Data Collection and Supervision

Throughout the survey implementation period, the NSO carried out data monitoring and quality checks. NSO staff conducted regular supervisory field visits and data entry checks for timely detection of recording and data entry errors. The NSO also developed and maintained real-time data monitoring dashboards used by the core team to review the quality of incoming data to minimise errors in a timely manner.

### 2.7.4 Data Entry and Management

Field teams entered data on their computers while they were in the field such that missing or inconsistent data could be checked and corrected by the team led by the supervisor, who was

accountable for in-field quality assurance. This allowed the team to go back to the household to get the correct data as needed. Using the real-time dashboard, quality checks were also carried out at the national/aggregate level by the NSO and the errors were relayed to the field teams immediately. This practice provided assurance on the quality of data collected and shortened the data processing. NSO did further processing including data cleaning and quality checks using STATA.

### **2.7.5 Organization of the report**

The rest of the report is organised as follows. Each chapter is roughly organised by the sections of the questionnaire as outlined in Table 2.2. Some chapters use questions from multiple sections of the survey. They present simple descriptive analysis mostly tabulating results by the 15 analytical domains, poor and non-poor, consumption quintiles along with other relevant categories of disaggregation in each section.

## CHAPTER 3: DEMOGRAPHIC CHARACTERISTICS

### 3.1 Introduction

Demographic characteristics primarily deal with the age and sex composition of the population. These statistics help to understand the socioeconomic conditions of people together with the size of the population, household, age and sex of the population. Other indicators such as the dependency ratio are also informative in understanding the economic burden on the productive population and social service delivery needs. Some highlights of demographic changes since 1995 that are important in policy planning are discussed below.

### 3.2 Distribution of population by age and sex

The population trend since NLSS I (1995) shows a shift towards a higher proportion of working age (15-59 years) and elderly population (Fig 3.1). The former could result in a demographic dividend and the latter points to the need for expanding social services and protection. The proportion of individuals below fifteen years of age has been on a decreasing trend and impacts the dependency ratio as discussed below. Box 3.1. shows the percentages in detail.

Figure 3.1: Percentage distribution of population by age group, 1995/96 - 2022/23

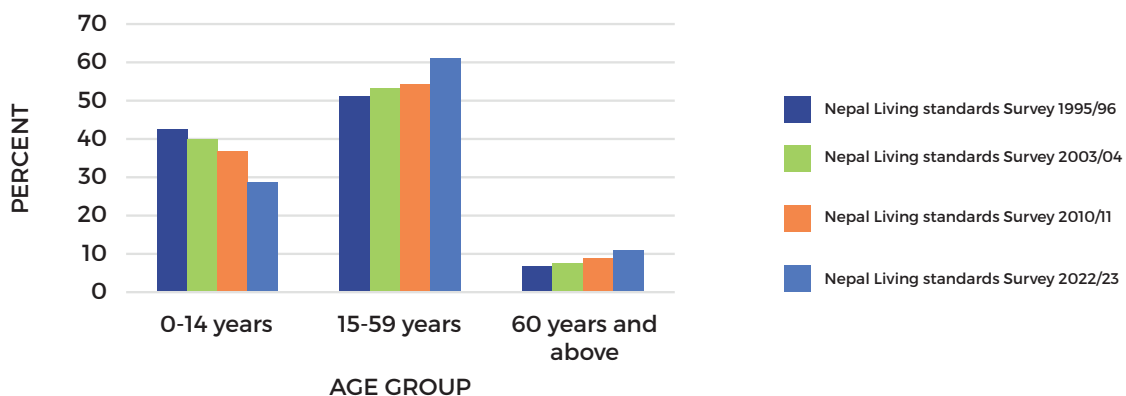

Table 3.1 further disaggregates the age distribution by urban and rural regions and shows that urban areas, especially Kathmandu Valley urban, have a higher proportion of young adults and lower proportions of children, which could be reflective of urban migration and economic opportunities. It also shows that rural areas have higher proportions of children.

Sex ratio provides the distribution of the male and female population by giving the number of males per hundred females. As of 2022/23, there are 89 males for every 100 females in Nepal, which is an increase from the last round. Sex ratios are lower than the national average in rural regions and urban regions except in Kathmandu Valley urban. They are also higher in the non-working age population (0-14 and 60 and above) compared to the average of those between 15 to 59 years of age (Table 3.1).

### 3.3. Dependency ratio

The dependency ratio is a demographic measure that compares the number of dependents (in this case 0-14 years of age and age 60 years and above) to the number of working-age individuals (15-59 in this case). It informs policymakers of the pressure on the productive population to support those who are less likely to be in the workforce. Consistent with the trend of a declining proportion of the population in its early years (0-14 years), the dependency ratio has also been declining in Nepal since 1995 (Figure 3.2).

Figure 3.2: Sex ratio, Dependency ratio, female household heads, 1995/96 - 2022/23

Dependency ratios are highest in Karnali and Sudurpaschim provinces (67.8 percent and 66.6 percent) and are generally higher in rural areas compared to urban areas (Table 3.2). While the national ratio stands at 56 percent, the lowest dependency ratio is in Kathmandu Valley urban (34 percent) among the 15 analytical domains and highest in Sudurpaschim rural (78.4 percent) closely followed by Madhesh rural with (78.1 percent).

Figure 3.3: Distribution of household by size, 1995/96 - 2022/23

### 3.4 Household size and distribution by size

The total number of individuals residing in a single household is the household size. The average household size of Nepal is 4.0 as of 2023. Figure 3.3 shows a significant demographic shift since 1995 showing a clear preference for smaller households in the population with consistent rise in 1-2 persons and 3-4 persons households and decline in household size bigger than 5.

The average household size varies across provinces, with Madhesh province having the highest average of 4.8 persons and Gandaki province having the lowest at 3.4 persons. Urban areas tend to have smaller household sizes compared to rural areas. Rural areas have a higher proportion of larger households, especially noticeable in Madhesh and Sudurpaschim provinces. (Table 3.3).

### 3.5 Sex and age of household head

NLSS-IV defines household head as the following: Household head is a member of the household who is responsible for the overall management and taking the decision of the households' affairs. In this survey, the minimum age of the household head is 10 years old. In other way, household head is a person, age 10 years and above, who take the decision of the households' affairs irrespective of the sex and seniority of the family. Since NLSS I (1995-96), there has been a notable growth in the percentage of female-headed households in Nepal. It had the largest increase of 10.5 percentage points compared to NLSS-III reaching 37.1 percent in 2022.

Gandaki province has the highest percentage of female household heads (46.9 percent), while Madhesh province has the lowest (31.4 percent). There are disparities between urban and rural areas within the same province. For instance, in Karnali province, the urban areas have a higher percentage of female household heads compared to rural areas.

The mean age of household heads across Nepal is 45 years. The age distribution varies across provinces and analytical domains (Table 3.6). For instance, Karnali province has the lowest mean age (42.6 years), while Gandaki province has the highest (46.5 years). In most provinces, the largest age group of household heads falls within the 40-49 age group, except for Karnali and Lumbini provinces, where it's the 30-39 age group. Gandaki province has the highest percentage of household heads aged 60 or more (21.9 percent), while Lumbini province has the lowest (17.1 percent).

Box 3.1: Summary statistics of demographic characteristics, 1995/96 – 2022/23

Description	Nepal Living Standards Survey			
	1995/96	2003/04	2010/11	2022/23
Percent of population (0-14 years)	42.4	39.6	36.7	28.3
Percent of population (15-59 years)	50.8	52.8	54.2	60.8

## CHAPTER 4 :HOUSING

### 4.1 Introduction

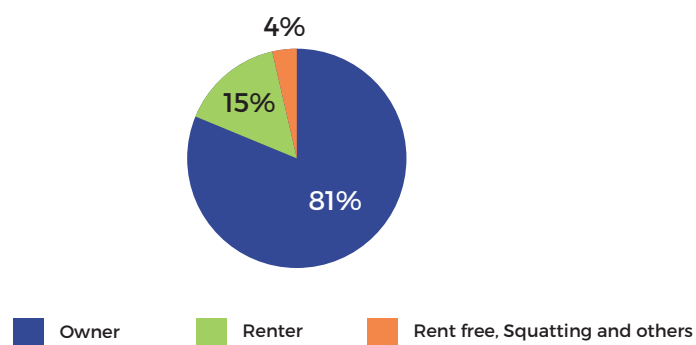

Housing is an important component of well-being. The survey tried to understand the characteristics of the dwelling in which the household members live, such as size, construction materials, and access to utilities such as electricity, piped water, cooking fuel, and sanitary facilities.

Since NLSS I (1995-96), house ownership has declined steadily, mostly absorbed by the increase in rental housing. This shows the change in people's living patterns. Overall, significant improvements in housing quality, access to utilities, and sanitation are seen over the surveyed period, reflected in the use of more durable construction materials. However, there are also differences based on economic status and urban and rural areas (Box 4.1 and Tables 4.1 to 4.12).

### 4.2 Occupancy status

The survey asked about the status under which the household occupies the dwelling—self-ownership, rented, given for free to live, squatting (living without the consent or knowledge of the property owner), and others. House ownership remains the predominant form of housing occupancy in the country. As of 2022, 81 percent of households own their dwelling, and 15 percent are renters.

Figure 4.1: Household occupancy status

Non-poor households have a higher rental rate (16.9 percent) compared to poor households (6.1 percent) (Table 4.1.). This trend is consistent across most provinces, with poor households in regions like Karnali (96.1 percent) and Sudurpaschim province (95.2 percent) having very high ownership rates. Non-poor households are those who fall above the poverty line. Rural regions exhibit higher house ownership (93.4 percent) compared to urban regions (82.8 percent in urban areas excluding Kathmandu Valley urban (KVU). KVU stands out with 53.4 percent of households renting their homes, significantly higher than any other region.

### 4.3. Construction material of outer walls

The percentage of households with cement-bonded walls has more than doubled since the last survey in 2010/11. Overall, 56 percent of households use cement-bonded bricks or stones for outer walls, indicating a significant preference for more durable construction materials (Table 4.2). However, there are substantial differences between poor and non-poor households. Poor households predominantly use mud-bonded bricks/stones (42.1 percent) and wood/bamboo/leaves (28.7 percent), whereas non-poor households predominantly use cement-bonded bricks/stones (62.2 percent).

KVU has the highest percentage of households using cement-bonded bricks/stones (86.0 percent), while Karnali and Sudurpaschim provinces show high usage of mud-bonded bricks/stones (78.1 percent and 45.0 percent, respectively). Urban areas outside KVU show 62.1 percent of households using cement-bonded bricks/stones. In contrast, rural regions have a lower percentage (32.4 percent), with 46.7 percent of rural households using mud-bonded bricks/stones. As expected, the richest consumption quintile predominantly uses cement-bonded bricks/stones (80.8 percent). In comparison, the poorest quintile has a substantial proportion using mud-bonded bricks/stones (42.2 percent) and wood/bamboo/leaves (28.7 percent).

### 4.4 Materials for roofing

The survey shows galvanised iron sheets and concrete/cement are commonly used (40 percent for both), but concrete/cement is predominantly used by non-poor households (Table 4.3). Urban areas, mainly Kathmandu Valley urban, display a prevalence of concrete/cement roofs. The distribution of roofing materials varies across consumption quintiles, with the wealthiest quintile predominantly using concrete/cement. In contrast, the poorest quintile shows higher usage of straw/thatch and tiles, indicating an economic influence on housing construction choices.

### 4.5 Materials for foundation

Mud-bonded, cement-bonded, and pillar-bonded foundations constitute the primary choices across all population segments (Table 4.4). However, the poor live more in houses with mud-bonded foundations (46 percent vs 25.5 percent). In comparison, the non-poor show a preference for cement-bonded foundations (31 percent vs 18 percent), suggesting higher economic capacity and infrastructure access. Provincial and urban-rural variations also exist. Mud-bonded foundations are highest in Karnali (83 percent) and lowest in Madhesh (6 percent) provinces. The wealthiest quintile favors cement-bonded and pillar-bonded foundations.

## 4.6 Materials for floors

For floor construction materials, concrete/cement-bonded floors are prevalent (54.1 percent) across the nation, with earth/mud floors being more common among poor households (77.0 percent) than non-poor households (35.2 percent) (Table 4.5).

Poor households in various provinces, such as Madhesh (82.7 percent), Bagmati (55.8 percent), and Sudurpaschim (88.5 percent) provinces, predominantly utilise earth/mud floors. In contrast, non-poor households generally favour concrete/cement bonded floors, as seen in provinces like Koshi (57.0 percent), Gandaki (64.5 percent), and Bagmati (81.1 percent) provinces.

## 4.7 Number of rooms, area of dwelling and housing plot

An essential part of the housing quality metrics is the degree of crowding measured through different indicators in NLSS-IV, as discussed below.

The average number of rooms in dwellings across the country is 4.8, and the average dwelling size is 594.8 square feet (Table 4.6). Non-poor households tend to have larger dwellings, with an average of 5.0 rooms and a mean size of 616.8 square feet, compared to poor households with smaller dwellings, with an average of 3.9 rooms and a mean size of 484.9 square feet. Additionally, both poor and non-poor households have a comparable average area of housing plots, with non-poor households having slightly larger plots at 2495.7 square feet compared to poor households' 2203.2 square feet.

Looking at the provincial level, Lumbini province has the highest average number of rooms (5.1) and the largest average dwelling size (746.3 square feet). Karnali province has the lowest average dwelling size (454.7 square feet) despite having a relatively high average number of rooms (4.8).

## 4.8 Access to drinking water and various amenities

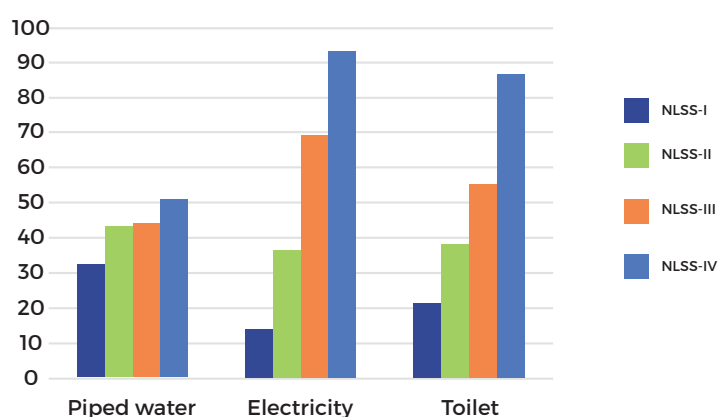

Access to drinking water through pipelines is relatively low at 40.2 percent for Nepal, access to the internet at 39.7 percent and access to cable TV at 28 percent. However, access to these amenities has steadily improved (Figure 4.2).

A significant portion, 11.4 percent, relies on piped water sources outside their houses (Table 4.7). Notably, 94 percent of the population has access to electricity, indicating widespread coverage. Regarding sanitation, 87.5 percent of the population has access, but there's a difference between poor and non-poor households (76 percent vs. 90 percent, respectively). Poor households also have lower access across all categories of amenities, notably to the Internet (9.5 percent vs. 45.7 percent) and cable TV (8.7 percent vs. 31.9 percent). (Table 4.8)

In Bagmati province, the highest percentage of piped water access to houses is observed at 55.9 percent, while Madhesh province has the lowest at 5.5 percent, but Madhesh province's primary drinking water supply is from hand pumps (88 percent). Madhesh province exhibits almost universal access to electricity at 98.5 percent, with others following close behind, but Karnali province stands out at the lowest at 58 percent. Poor households in Karnali province face significant challenges, with only 38.8 percent having access to electricity, much lower than other poor households in different provinces.

Bagmati province has the highest internet access at 59.8 percent, well above the national average of 39.7 percent, whereas Karnali province has the lowest at 14 percent. Disparities are evident among poor households, with poor households in Sudurpaschim province having the lowest access at 4.3 percent compared to 19.7 percent in the region overall. Gandaki province leads in sanitation coverage at 95.7 percent, while Madhesh province has the lowest at 79.5 percent.

**Figure 4.2: Access to household amenities and facilities, 1995/96 - 2022/23**

## 4.9 Main fuel used for cooking

Across the country, firewood is the most common fuel used by households (50 percent), a decline from NLSS-III by 14 percentage points (Table 4.9). This is balanced out by a substantial increase in the adoption of liquid petroleum gas (LPG), which increased from 18 percent in NLSS-III in 2010 to 46.6 percent. Electricity, cow dung, biogas, and other fuels constitute a minor share, with electricity and biogas being particularly low (0.4 percent and 1.1 percent, respectively).

Poor households predominantly use firewood (82.1 percent), have very low LPG usage (12.8 percent), and use cow dung (3.2 percent) more than the national average.

Cooking fuel usage varies across provinces. Koshi province predominantly uses firewood (51.6 percent) and LPG (42.6 percent), with the poor relying more on cow dung (5.2 percent). Madhesh province shows the highest reliance on firewood (66.8 percent) and low LPG usage (28.9 percent), with poor households using more cow-dung (5.9 percent). Bagmati province stands out with dominant LPG

use (74.1 percent) and low firewood usage (24.0 percent), although poor households still use more firewood (62.0 percent). Gandaki and Lumbini provinces display a balanced usage of firewood and LPG. In contrast, Karnali and Sudurpaschim provinces heavily rely on firewood (78.9 percent and 69.2 percent, respectively) with low LPG use.

#### 4.10 Firewood collection and used

Among households that collected and used firewood across the country, 73.0 percent used firewood during a reference year, with the remaining 27.0 percent not using it. Firewood usage is significantly higher among poor households, at 93.3 percent, while 69.0 percent of non-poor households rely on firewood (Table 4.10).

Koshi province has 80.3 percent of households using firewood, with 96.5 percent of the poor relying on it. Karnali province has the highest usage at 91.3 percent, with 99.5 percent of poor households using it, while Bagmati province has the lowest usage at 40.9 percent, with non-poor households at 37.1 percent. Other provinces like Gandaki (70.4 percent), Lumbini (80.0 percent), Madhesh (87.5 percent), and Sudurpaschim province (89.5 percent) show high reliance on firewood, especially among poor households, exceeding 90 percent.

#### 4.11 Places of firewood collection

Across the country, 32.8 percent of households collect firewood from their own land, 28.4 percent source it from community-managed forests, and 18.1 percent purchase it (Table 4.10). Poor households show a higher dependency on community-managed forests (42.3 percent) and other sources (24.8 percent) compared to non-poor households (25.6 percent and 12.2 percent, respectively).

Madhesh province shows a unique trend where 40.3 percent of households purchase firewood, and 40.5 percent source it from other means, particularly among the poor (55.0 percent). Bagmati province has the lowest purchase rate (5.8 percent). Gandaki province presents a moderate scenario, with 37.4 percent using their own land and 33.5 percent relying on community-managed forests. Lumbini province highly relies on own land (41.6 percent) and community forests (38.8 percent), especially among poor households. Karnali province stands out with the highest reliance on community-managed forests (70.3 percent), and poor households show an even higher dependency (84.6 percent).

Across consumption quintiles, the poorest households show significant use of community-managed forests (42.5 percent) and other sources (24.6 percent), while the wealthiest quintile has the lowest reliance on these sources (14.7 percent and 5.4 percent, respectively). In urban versus rural domains, Kathmandu Valley urban has minimal use of all sources, with only 4.3 percent using their own land. In contrast, rural regions highly rely on their own land (52.0 percent) and community-managed forests (39.6 percent).

Specific areas, Lumbini Rural and Koshi Rural exhibit high usage of own land (59.6 percent and 56.3 percent respectively) with Bagmati Rural showing highest reliance on own land at 62.4 percent. Karnali Rural reflects the highest use of community-managed forests (76.2 percent) followed by Sudurpaschim Rural (71.6 percent), indicating a strong dependency on communal resources in rural areas.

## 4.12 Stove used for cooking

This indicator helps understand the issue of indoor air pollution in households using certain types of cooking stoves. Overall, in the country, 47.4 percent of households use gas stoves, followed by 32.9 percent using mud/clay stoves, and 15.3 percent relying on open fireplaces.(Table 4.11) Among the poor, 56.3 percent use mud/clay stoves, and only 13.3 percent use gas stoves, whereas among the non-poor, 54.3 percent use gas stoves and 28.2 percent use mud/clay stoves.

Bagmati province has the highest use of gas stoves at 74.6 percent, with only 10.0 percent using mud/clay stoves. Karnali province is different from other provinces with 49.3 percent of households using open fireplaces, higher than any other province.

Overall, the poorest households mainly use mud/clay stoves (56.3 percent) and open fireplaces (25.9 percent), while the wealthiest quintile shows high usage of gas stoves (80.0 percent) and low reliance on mud/clay stoves (10.5 percent). In urban versus rural, Kathmandu Valley urban stands out with 96.0 percent of households using gas stoves, and only 1.4 percent using mud/clay stoves. Other urban regions also show a preference for gas stoves (51.0 percent), while rural regions rely more on mud/clay stoves (42.3 percent) and open fireplaces (28.4 percent).

**Box 4.1: Summary statistics of household characteristics**

Description	Nepal Living Standards Survey

## CHAPTER 5: ACCESS TO FACILITIES

### 5.1 Introduction

NLSS-IV measures access to major facilities such as education, health, road infrastructure, market, agriculture, banking and finance, sources of drinking water, security (police), administrative services (ward office), and public library. The survey measures access as 'near to home' and 'time taken' using different modes of transport (including walking) and distance in kilometres. This section discusses access on the 'time taken to reach these facilities' indicator. Tables 5.1 to 5.25 also provide the mean time in minutes to access these facilities.

Accessibility continues to improve universally from the last rounds, except in a few cases. Notable improvements (percent of households within a 30-minute reach to the facilities) are seen in the access to a paved road (29 percentage points jump), market Centre (28 percentage points jump), agricultural centre (32 percentage points jump), and cooperatives and banking (29 percentage points and 34 percentage points jump respectively) (Box 5.1). The categories on education and health differ from NLSS-III and thus are not directly comparable. Box 5.1.1 provides summary statistics for education and health facility access within 30 minutes.

### 5.2 Education

A large portion of the households reported educational facilities for all levels (Early childhood development centre, basic grades (1 to 8), secondary grades (9-12), university (beyond 12), to be 'nearby home' or 'reach within 30 minutes' using different modes of transport (walking, cycle, motorcycle, car, rikshaw, e-rikshaw/tempo, taxi, bus/jeep). In 2022/23, access to educational facilities in Nepal is relatively high, with 95.9 percent of households within 30 minutes of an Early Childhood Development Centre (ECD), 90.8 percent of households within 30 minutes of a basic school (Grades 1-8), 79.9 percent within 30 minutes of a secondary school (up to Grade 12), and 60.9 percent within 30 minutes of a college, campus, or university. As is evident, access gradually decreases as the level of education increases.

Across all provinces, over 90 percent of households can access an Early Childhood Development (ECD) centre within 30 minutes (Table 5.1). However, access varies at higher educational levels. In Karnali province, the lowest percentage of households report access to educational facilities within 30 minutes across all levels: 75 percent for basic, 52 percent for secondary, and 24 percent for university, all well below the national averages in Box 5.1.1 (Table 5.2-5.4). Madhesh province has the highest access, with 99 percent for basic and 95 percent for secondary education. For tertiary education, Bagmati province

reports the highest proportion of households with access to colleges or universities within 30 minutes at 75 percent, followed by Madhesh and Lumbini provinces, both above 60 percent. This indicates a concentration of tertiary education facilities in specific provinces.

### 5.3 Health

Access to health facilities varies across facility types for Nepal, based on NLSS-IV (Box 5.1.1). 70.6 percent of households are within 30 minutes of a Health Post, while 62.1 percent have access to a Basic or Urban Health Centre. Only 44.9 percent of households are within 30 minutes of a Primary Health Centre, and 46.5 percent can reach a Government Hospital within the same time. Access to private health facilities is notably higher, with 80.6 percent of households within 30 minutes of a Private Clinic and 56.1 percent within reach of a Private Hospital. Community hospitals are less accessible, with only 32.9 percent of households nearby.

There are significant variations in access to health facilities across different provinces. Bagmati and Lumbini provinces stand out with high accessibility, with 78.0 percent and 78.5 percent of households, respectively, being within 30 minutes of a Basic Health Centre and over 75 percent having access to a Health Post. Madhesh province shows notable access to private health facilities, with 87.6 percent of households within reach of a Private Clinic and 69.4 percent of a Private Hospital. Conversely, Karnali province has the lowest access, with only 43.1 percent of households near a Basic Health Centre and just 11.0 percent near a Primary Health Centre. Sudurpaschim province also has comparable limited access levels (Table 5.5 – 5.11).

### 5.4 Road transport

NLSS-IV surveyed access to two types of roads – paved and unpaved roads, where a vehicle had to be passable on the unpaved road (Table 5.12-5.13). Access to paved roads is quite high across the country, with provincial variation. Eighty per cent of households have a 30-minute reach of a paved road, a marked improvement from NLSS-III (Box 5.1). In urban areas, this accessibility is notably high, with Kathmandu Valley Urban reaching 99.6 per cent and other urban regions at 88.7 per cent. In contrast, rural regions have significantly lower accessibility, with only 55.5 per cent of households within 30 minutes of a paved road. Provinces like Madhesh and Bagmati show high accessibility. Conversely, Karnali province exhibits the lowest accessibility, with only 35 per cent of households within 30 minutes and 18 per cent of households taking more than 3 hours to reach a paved road. Poor households face lower accessibility, with 67 per cent within 30 minutes, compared to 83 per cent of non-poor households. Table 5.13 presents information on unpaved roads.

## 5.5 Market Centre

Access to markets in NLSS-IV is measured in terms of access to two types of market: first is a haat bazaar, small and local open-air markets, and second through a main/core market or a bazaar.

Nationally, 44.8 percent can reach a haat bazaar (market) within 30 minutes, but an equal share reports that access to haat bazaars is not applicable (Table 5.14). The haat bazaars are more common in Koshi and Madhesh provinces and least common in Bagmati, Gandaki, Karnali and Sudurpaschim provinces, with over 62 percent of households reporting it as “Not applicable”.

Across the country, 72.7 percent of households are within 30 minutes of a core market, which is a significant improvement from NLSS-III (Box 5.1). This accessibility varies across provinces. Madhesh province has the highest proportion of households within 30 minutes of access at 76.1 percent, followed closely by Lumbini province at 77.2 percent. Conversely, Karnali and Sudurpaschim provinces have lower accessibility, with 61.9 percent and 59.5 percent of households, respectively, within 30 minutes. Urban areas, particularly Kathmandu Valley urban, exhibit the highest accessibility, with 99.1 percent of households within 30 minutes, whereas rural regions lag significantly, with only 50.9 percent of households within the same timeframe. Non-poor households have better access, with 76.7 percent within 30 minutes compared to 52.8 percent of poor households (Table 5.15).

## 5.6 Agricultural and animal service/vet centre

Many households report more access to agricultural and animal service/vet centres than NLSS-III (Box 5.1). Overall, 74.6 percent of households are within 30 minutes of such a service centre. Koshi and Madhesh provinces have the highest accessibility, with 71.4 percent and 86.6 percent of households respectively within 30 minutes. In contrast, Karnali province shows the lowest accessibility, with only 47.4 percent of households within 30 minutes and significant percentages needing more than 1 hour, with 19.7 percent requiring 1-2 hours and 18.1 percent needing more than 2 hours.

Urban areas demonstrate better access compared to rural areas. In Kathmandu Valley urban, 92.2 percent of households are within 30 minutes of a service centre, whereas in rural regions, this figure drops to 57.2 percent. Non-poor households again have better access, with 77.3 percent within 30 minutes, compared to 61.1 percent of poor households. Additionally, poor households have notable proportions that require more than an hour to reach these centres, with 13.6 percent needing 1-2 hours and 6.8 percent requiring more than 2 hours.

## 5.7 Cooperatives and bank

Most households in Nepal can access cooperatives and banks within 30 minutes, as NLSS-IV shows (Table 5.17 – 5.18). Access to banks has grown by 85 percent and cooperatives by 55 percent, reaching 83.3 percent for cooperatives and 74.2 percent for Banks (Box 5.1).

Among the provinces, Bagmati province exhibits the highest accessibility, with 89.1 percent of households within 30 minutes of a cooperative (Table 5.17). In contrast, Karnali province shows the lowest accessibility, with only 56.1 percent of households within 30 minutes, a notable 15.7 percent needing 1-2 hours and 16.2 percent requiring 2-3 hours. Urban areas demonstrate better access compared to rural areas. In Kathmandu Valley urban, 99.9 percent of households have a cooperative nearby or within 30 minutes. Other urban regions have 89.1 percent of households within 30 minutes, whereas rural regions have significantly lower accessibility, with only 65.5 percent of households within 30 minutes. Poor households exhibit higher percentages of needing more than an hour to reach a cooperative, with 13.5 percent requiring 30 minutes to 1 hour and 9.6 percent needing 1 to 2 hours.

The variation follows the same pattern in the case with access to Banks (Table 5.18). Bagmati province has the highest accessibility, with 79.8 percent of households within 30 minutes. In contrast, Karnali has the lowest accessibility, with only 39.3 percent of households within 30 minutes and a significant 44.4 percent needing more than an hour.

## 5.8 Source of drinking water, police station, ward office, and community library

Access to police stations signifies access to government security services, while access to ward offices denotes access to essential government administrative services. Most households are within 30 minutes of reaching a police station and ward office nationally (77.4 percent and 83.3 percent, respectively). This is true for all provinces except Sudurpaschim province for the nearest police station (only 60 percent) (Table 5.21 and 5.22). The community library is one of the few facilities with declining access compared to the last round in 2010/11. Access to the library within 30 minutes has decreased by almost three percentage points. Notable is the proportion of households that report the question as not being relevant in provinces, mainly in Karnali (88 percent), Sudurpaschim (79.8 percent), and Madhesh and Koshi provinces, both close to 50 percent (Table 5.23).

### Box 5.1: Summary statistics on access to facilities (Percent of households within 30 minutes reach to facilities)

Facility	Nepal Living Standards Survey

# CHAPTER 6: LITERACY AND EDUCATION

## 6.1 Introduction

Education is a cornerstone of wellbeing as it is strongly related to social and individual prosperity. The survey offers insights into access and outcomes of education across various demographics. By examining enrollment rates, literacy levels and educational attainment, this chapter presents an in-depth analysis of the current state of education in Nepal, highlighting key trends, regional variations, and the impact of socio-economic factors.

Overall, the results highlight a positive educational access and outcomes trend, with all the indicators improving over the last decade. Nevertheless, access and outcome vary by sex, socioeconomic status and provinces.

The comparison of trends in educational outcomes across different education levels is affected by the changes in the administrative classification of schooling levels since the last survey round. Previously, education levels were classified into primary, lower secondary, secondary, higher secondary and tertiary levels. According to the New Education Act, the current classification divides schools into basic, secondary, and tertiary levels, thus not directly comparable to the previous classification.

## 6.2 Literacy Rates

In 2023, Nepal's literacy rate has improved, with the overall adult literacy rate for individuals aged 15 years and above rising to 72.5 percent from 56.5 percent in 2010/11. This improvement was more pronounced among the younger population, with the youth literacy rate climbing to 97.6 percent and 93.7 percent among those aged 15-19 and 20-24, respectively, indicating a successful emphasis on education for newer generations (Table 6.1).

Male literacy rates have consistently been higher than female rates over the decades, but both have seen notable increases over time. Male literacy rose by 11 percentage points from 71.6 percent to 82.9 percent over the past decade, while female literacy gained about 20 percentage points rising from 44.5 percent to 64.1 percent. Despite these gains, gender disparity remains a challenge, though the gap is narrowing, indicating ongoing efforts to achieve gender parity in education. The narrowing gender disparity among the younger generation is particularly noteworthy, with literacy rates for males and females aged 15-19 nearly equal at 98.2 percent and 96.9 percent, respectively.

Literacy rates across the provinces exhibited considerable variation, reflecting regional disparities in educational attainment. Bagmati province leads with the highest adult(15+) literacy rate at 80.2 percent,

followed closely by Gandaki at 79.6 percent. In contrast, Madhesh province had the lowest literacy rate at 60.6 percent, indicating significant educational outreach and resource challenges. These figures highlight the need for targeted educational interventions to address regional imbalances and ensure equitable access to education nationwide.

The provincial disparity between urban and rural areas is striking. The KUV leads other urban regions by 15 percentage points, while rural Nepal lags significantly behind with an adult literacy rate of only 65 percent. Nevertheless, gender disparity persists even in the KUV, with 82.3 percent literate females compared to 94.2 percent literate males.

Socio-economic background also plays a crucial role in literacy rates. The richest consumption quintile has the highest adult literacy rates at 86.8 percent. Conversely, the poorest consumption quintile has the lowest literacy rates, with 56.6 percent illiterates among the population aged 15 years and older. Surprisingly, gender disparity in literacy rates between the richest and the poorest is almost equal, with a gender gap of about 15 percentage points at different levels. This indicates that despite economic differences, the challenge of gender disparity in literacy remains a consistent issue across socio-economic groups.

### 6.3 Educational Status

The educational status of the respondents is categorised into three groups: a) never attended school, b) attended school in the past, and c) currently attending school. Overall, the educational status of the population has vastly improved compared to the 2010/11 survey, as 70.2 percent of the population 15 years and above in 2022/23 have ever attended school, a 15.6 percentage point growth over a decade (Table 6.8).

The results underscore the significant influence of gender, economic status, and regional factors on educational attainment in Nepal. Across Nepal, more females of age 59 years and older (31.9 percent) have never attended school than males (14.8 percent). Additionally, more males (31.1 percent) are currently in school than females (29.0 percent) (Table 6.4). Currently, attendance rates for children aged 14 and below are consistently high across all the provinces. Even Madhesh province, which has the worst educational outcomes, has 92.4 percent of its 10-14-year-old children currently in school, but the rate drops to 55.4 percent for the 15-19-year-olds and drops further for the older cohorts (Table 6.5). The poorest consumption quintile has the highest percentage of individuals who have never attended school (73.5 percent for males and 60.6 percent for females) (Table 6.1).

### 6.4 Net Enrollment Rate

Net Enrollment Rate (NER) measures the percentage of students in a specified age group who are

currently attending school at the appropriate level for their specified age. For instance, the basic school attendance rate represents the percentage of children of basic school-going age (5-12) attending basic school. The age groups used for computing net attendance rates are 5-12 years for basic school, 13-16 years for secondary, and 17-22 years for tertiary levels.

For all, the NERs have drastically improved over the last decade. By gaining 30 percentage points, this rate has dramatically increased to 96.2 percent for both sexes in 2022/23 for basic school going children, showcasing significant footstep toward gender parity and overall improvement in primary education access (Table 6.11).

In sharp contrast to the nearly universal NER among children in basic education, the NER drops to less than 50 percent for secondary school students and plummets to just 17 percent for young adults attending tertiary education. Continuing the trend observed in 2010/11, the net attendance rate (NER) for girls in secondary and tertiary education remains slightly higher than for boys.

## 6.5 Gross Enrollment Rate

Gross enrollment rate (GER) is defined as the ratio of the total number of students enrolled at a given level of education, irrespective of their age, to the total number of children in the age group specified for that level of education. The GER at the basic level is high across all provinces, urban/rural regions, consumption quintiles, and poverty status categories. The GER for boys and girls is above 110 percent in almost all categories, indicating that students are outside the typical age group enrolled at this level. The GER drops significantly at the secondary and tertiary levels compared to the basic level. Urban areas generally have higher GERs at all education levels than rural areas. Non-poor populations have higher GERs at all education levels compared to poor populations. GERs for boys and girls are fairly similar at the basic level, but at the secondary level, girls have higher GERs than boys in several provinces.

## 6.6 Mean Years of Schooling

Both men and women have an average of 8.9 years of schooling (Table 6.8). The poor have an average of 7.2 years of schooling, whereas the non-poor have a higher average of 9.1 years of schooling. Bagmati province has the highest mean years of schooling for men (9.9 years) and women (9.9 years), followed closely by Sudurpaschim province. Males have higher mean years of schooling than females in all provinces except Bagmati province. The widest gap is observed in Madhesh province, where men average 8.2 years and women average 7.9 years of schooling.

Mean years of schooling peaks among young adults in urban areas aged 20-29, with 10.1 years on average (Table 6.9). Older age groups have significantly lower mean years of schooling, reflecting historical educational disparities. Females aged 60-65 have only 5.8 years of schooling on average compared to 7.9 years for their contemporary male.

## 6.7 Type of School Attended

The schools/colleges in Nepal are normally categorised into private/institutional and government/community, and their prevalence varies across different provinces and regions. Across Nepal, the majority of students attend government/community schools (62.9 percent), followed by private/institutional schools (35.3 percent), and a small percentage attend other schools (1.8 percent) (Table 6.12).

Economic status significantly influences the type of school attended. Poorer households are more likely to send their children to government schools (90.8 percent) due to the lower cost than private institutions. Non-poor households opt for private schools (55.9 percent), likely due to perceived or actual quality differences, better facilities, and more opportunities.

Urban areas generally have more students attending private schools than rural areas. KUV has the highest percentage of students attending private institutions (67.7 percent). In Bagmati province, private institutions enroll half of the student population, whereas in Karnali province, only 14 percent of students attend such institutions.

## 6.8 Reasons for Dropout

The insights from Table 6.13 on the reasons for leaving school/college provide valuable information regarding Nepal's educational landscape and challenges. The most common reason is poor academic progress cited by over a quarter of all dropouts. This highlights the importance of addressing issues related to academic support, teaching quality, and educational resources to ensure that all students have the opportunity to succeed academically, regardless of their socioeconomic background.

The second most commonly cited reason is family responsibility (21.4 percent), followed by early marriage (19.2 percent), indicating that familial obligations often compete with educational pursuits, particularly in rural areas where traditional gender roles and family structures may prioritise domestic duties over schooling. In certain regions, such as Karnali and Sudurpaschim provinces, a significant proportion of students leave school due to marriage, with percentages exceeding 32 percent. Early marriage often truncates educational opportunities, particularly for girls, perpetuating cycles of poverty and gender inequality.

Among the affluent, as well as those residing in Bagmati province and KUV, work or job opportunities appear as a prominent reason for leaving school. This indicates employment opportunities available to them as alternatives to furthering education.

The cost of education also emerges as a significant barrier, with percentages ranging from around 2.8 percent to 11.15 percent. This suggests that the affordability of education remains a considerable challenge for families, particularly in less affluent regions.

## 6.9 Educational Expenses

As mentioned in the last section, education can financially burden many. Tables 6.14 through 6.16 show that tuition fees are the largest expenditure category. Educational expenses vary considerably across the provinces and the socio-economic gradient. The tuition fees for private schools are, on average, ten times higher than those of government schools.

**Box 6.1: Summary statistics of literacy and education**

Nepal Living Standards Survey				
	1995/96	2003/04	2010/11	2022/23

# CHAPTER 7: HEALTH SERVICES

## 7.1 Introduction

Health is crucial to measuring living standards as it directly impacts quality of life and productivity. Understanding health metrics better helps inform policies to improve public health and well-being. NLSS-IV reports on the incidence of communicable diseases or injuries and non-communicable diseases, doctor consultations, associated expenditures, disability, and mortality.

Box 7.1 shows summary statistics on some key indicators related to health from 1995/96 to the latest round, 2022/23. It shows an increase in non-communicable and communicable diseases, with a much more significant increase for the later. A notable proportion of the population still does not consult health practitioners (22%).

## 7.2 Non Communicable Diseases

The NLSS-IV asks about non-communicable diseases, such as cancer, asthma, etc. Table 7.1-7.4 reports incidences for all 18 categories, further disaggregated by several variables such as province, analytical domains, sex, and poverty status.

Overall, the incidence of non-communicable diseases has steadily increased in the population and has increased by almost seven percentage points since 2010/11, reaching 18.5 (Box 7.1). The incidence for females is about five percentage points higher than for males, but the spread is close to even across provinces (Table 7.1). High/Low Blood Pressure is the most prevalent chronic illness across most consumption quintiles and sexes, with the highest rate among the wealthiest males at 31.3 percent and the lowest among the poorest females at 11.9 percent (Table 7.3). This is closely followed by gastrointestinal diseases, significantly more prevalent among females, especially among the poorest (22.8 percent) and second quintile (20.4 percent) females, compared to their male counterparts. Similarly, the prevalence of diabetes increases with wealth, with the highest rates among the wealthiest males at 20.1 percent and females at 10.9 percent, compared to the poorest quintile, which stands at 3.0 percent. Asthma/respiratory conditions are particularly prevalent among the poorest males (12.3 percent), females (10.9 percent), and males in the second and third consumption quintiles. This is described by poverty status in Table 7.2.

## 7.3 Communicable Diseases

Communicable diseases or injuries in the last 30 days at the time of enumeration is captured in the survey is reported in 15 different categories. Overall, 24.9 percent of the population reported being sick

and injured in the last 30 days (Table 7.5), with cold/fever and other fever as leading types of illnesses (51.5 percent and 26.4 percent, respectively) (Table 7.6). This is similar to the trend in the last round. However, the population reporting diarrhoea has decreased significantly from 16 percent in NLSS-III to 6.6 percent in NLSS-IV.

Lumbini province reports the highest prevalence of communicable diseases, with 29.6 percent among females and 28.2 percent among males, averaging 29 percent. In contrast, Bagmati province has the lowest prevalence, with 21.2 percent among females and 19.6 percent among males, averaging 20.4 percent in Table (7.5).

The distribution of communicable diseases varies across provinces and by illness type. For instance, malaria is most common in Lumbini (22.07 percent) and Karnali province (17.24 percent) in terms of the provinces' share. In comparison, skin diseases are most prevalent in Lumbini (31.55 percent) and Karnali province (19.25 percent) (Table 7.7).

## 7.4 Health consultations with medical practitioners

For those reporting communicable diseases within the last 30 days, the survey asked about consultations with medical practitioners. 77.8 percent of the population seeks some form of consultation for communicable diseases (Table 7.8). People reported going to a pharmacist the most (39.3 percent), followed by a doctor (29.3 percent), paramedic (5.3 percent), others (3.8 percent), Kaviraj/Vaidya (ayurvedic health practitioner) (0.2 percent). Consultations with pharmacists and doctors have increased since NLSS-III. Madhesh province has the highest percentage of consultations with pharmacists (62.0 percent). In comparison, Sudurpaschim province has a significant proportion of consulting "others" (16.8 percent) and the lowest with doctors (18.9 percent). The poorest quintile has a higher non-consultation rate (23.4 percent) and a higher reliance on pharmacists (40.8 percent) compared to the wealthiest quintile, where non-consultation is lower (23.5 percent) and doctor consultations are higher (37.9 percent).

## 7.5 Health consultations by facility type (government and private)

For communicable diseases, the survey asked about the type of facility they visited for treatment. A significantly larger proportion of the population uses private health facilities (57.9 percent) compared to the government (31.7 percent) (Table 7.9). The use of private hospitals is highest in Kathmandu Valley urban (44.4 percent) and Gandaki province (43.5 percent). In contrast, the reliance on government hospitals is more pronounced in Karnali (38.4 percent) and Sudurpaschim provinces (27.7 percent). Poor individuals are more likely to not visit any health facility (16.2 percent) compared to non-poor individuals (9.2 percent) (Table 7.9).

## 7.6 Health expenditure and source of funds

The survey inquired about the amount of expenditure and the source of funds for health-related expenses concerning non-communicable diseases conditions (covering spending over the past 12 months) and communicable diseases (covering spending over the past 30 days). Overall, the mean expenditure on communicable disease in the past 30 days is Rs. 1,704, primarily driven by expenditure on medicine, the most significant portion of the total expenditure of Rs. 857 (Table 7.10).

For non-communicable diseases, the highest expenditure is observed in Bagmati province (Rs. 37,793.5) and the lowest in Karnali province (Rs. 20,635.2) (Table 7.11). Non-poor individuals predominantly use self-savings (86.5 percent vs. 13.5 for poor individuals) and insurance (93.2 percent) to cover treatment expenses (Table 7.12). In contrast, poor individuals rely more on subsidies (42.5 percent) and loans (28.9 percent) (Table 7.12). The pattern is similar for communicable diseases as well (Table 7.13).

## 7.7 Disability

NLSS-IV collected information on various impairments such as visual, hearing, physical, mental, personal care, and speech-related challenges to estimate the functional disability. NLSS-IV employed a measure of disability, utilising the Analytical Guidelines based on the recommendation of the Washington Group on disability statistics. This acknowledges disability as a continuum of difficulty in functioning. Therefore, NLSS-IV uses a four-point scale for the continuum to ask if a person has the abovementioned impediments. The categories are No Difficulty, Some Difficulty, A lot of difficulty and cannot do at all. Based on this approach, the population of those with disability using these four different thresholds produces the following four disability identifiers:

Type 1: The level of inclusion is at least one domain/question is coded as 'some difficulty' or 'a lot of difficulty' or 'cannot do' at all. 8.1 percent of the population reported this type of disability in 2023 (Table 7.14).

Type 2: The level of inclusion is at least two domains/questions are coded 'some difficulty' or any one domain/question is coded 'a lot of difficulty' or 'cannot do at all'. 3.5 percent of the population report this type of disability.

Type 3: The level of inclusion is any one domain/question that is coded 'very difficult' or cannot be done at all. 1.8 percent of the population reports this type of disability.

Type 4: The level of inclusion is any one domain that is coded 'cannot do at all'. 0.5 percent of the of the population report this type of disability.

Table 7.15 further disaggregates disability and its type by sex and province.

Box 7.1: Summary statistics of health services

Box 7.1: Summary statistics of health services				
	Nepal Living Standards Survey			
Description	1995/96	2003/04	2010/11	2022/23

Use of condom	-	-	50.4	NA
Limit sex to a single partner.	-	-	36.0	NA
Avoid use of needles (injection)	-	-	26.9	NA
Avoid blood transfusion	-	-	25.9	NA
Disability				
Both sexes	-	-	3.6	2.3*
Males	-	-	4.2	2.4*
Females			3.0	2.2*

Note: Percentage of communicable diseases and consultation to health practitioner do not add up 100 as only select categories are reported on this table. For detail, see tables at the end of the chapter.

NA - these questions were not asked in NLSS-IV.

\*Figures not directly comparable due changes in method used in NLSS-IV compared to NLSS-III. In the method used for NLSS-IV, for the purpose of calculating prevalence, a person is considered to have a disability if they answer "a lot of difficulty" or "cannot do at all" to any of the six questions.

# CHAPTER 8: MIGRATION

## 8.1 Introduction

Migration refers to people's geographical or spatial movement from one geographical unit to another to stay temporarily or permanently in a new location. It involves a change of the migrant's usual place of residence from the "place of origin" to the "place of destination". Migrants can move within the country (internal migration) or across national borders (international migration).

A migrant is a person who moves from one place to another, especially to find work or better living conditions. Migrants can move either within the country (internal migration) or across national borders (international migration). In this survey, the local level (Rural municipality or Municipality) has been considered as a unit of migration within the country. This chapter focuses more on internal and local-level migration and movements between municipalities.

## 8.2 Status of migrants

The summary statistics of the migration of the population from 2003/04 to 2022/23 are shown in Box 8.1. They highlight a slight increase in the overall internal migration rate from 36.9 percent in 2010/11 to 38.1 percent in 2022/23, with a significant gender variation. 49.6 percent of females compared to 25.0 percent of males were living in a place other than their place of birth in 2022/23 (Table 8.1).

The migration trends for males and females diverge significantly. The proportion of males that migrate internally has continued to decrease - starting over 50 percent in 2003/04, it reached 36.1 in 2010/11 and dropped to 25.0 percent in 2022/23. In contrast, the likelihood of females migrating has more than doubled over the period, rising from 21.6 percent in 2003/04 to 49.6 percent in 2022/23 (Box 8.1). This shift indicates a substantial change in the demographic composition of migrants, with females increasingly becoming the majority of the internal migrant population by 2022/23.

For provinces, Bagmati province stands out with the highest overall migrant population at 49.8 percent, as expected, driven by high female immigration rates. 57.5 percent of females in Bagmati are migrants (Table 8.1). Madhesh province also shows a significant gender difference, with 51.4 percent of females being migrants compared to only 6 percent among males. Sudurpaschim province has the lowest migrant percentage at 32.4 percent, again with a marked difference between females (41.2 percent) and males (20.9 percent).

The likelihood of being migrants among the non-poor population consistently has a higher percentage across all provinces. For instance, in Lumbini province, migrants account for 43.2 percent among the non-poor population, compared to only 22.1 percent among the poor. This trend is also pronounced in Koshi province, where 44.0 percent of non-poor individuals are migrants compared to 30.0 percent of poor individuals.

Kathmandu Valley urban has the highest number of immigrants; 60.2 percent of the population is immigrants, with a remarkably high female migration rate of 66.9 percent. In contrast, rural areas across all provinces show significantly lower migration rates, with the lowest in Karnali rural at 16.8 percent, reflecting a wider national trend where rural migration (26.7 percent) lags behind urban migration (39.9 percent). Urban areas, excluding KVVU, still show a considerable migrant presence at 39.9 percent, highlighting the draw of urban centres for migrants across the country.

### **8.3 Origin of migration: first out-migration from birthplace**

NLSS-IV asks about the first outmigration from a place of birth. Among the migrant population, 29.5 percent of the population's first outmigration from their birthplace has been from rural areas, 5.1 percent from urban areas, and 3.5 percent from outside Nepal (Table 8.2). Bagmati has the highest proportion of migrants from rural areas at 40.1 percent, coupled with a notable 8.2 percent from urban areas. In contrast, Karnali province stands out with a high percentage of the population never having migrated (76.7 percent). Madhesh has the highest proportion of migrants from outside Nepal at 6.1 percent, indicating a stronger international migration pattern.

Kathmandu Valley urban shows a significant trend, with 47.3 percent of its migrant population originating from rural areas and only 39.8 percent never having migrated, the lowest non-migration rate. In contrast, rural areas in Bagmati have a high non-migration rate of 77.3 percent and only 19.7 percent from rural origins.

### **8.4 Reason for migration: first out-migration from birthplace**

The primary reason for the first out-migration from birthplace in Nepal is marriage, accounting for 49.3 percent of the migrant population, followed by 'following the family' at 25.6 percent. Education and training motivate 7.3 percent of migrants, while 7.1 percent migrate for work. (Table 8.3)

Madhesh has the highest proportion among provinces, 87.3 percent, of its migrants moving for marriage, starkly contrasting to other areas. Bagmati, while still having a significant 33.1 percent of its migrants moving for marriage, shows a more diverse range of reasons, including 'looking for work' at 15.0 percent and education at 11.4 percent. Karnali province stands out with 48.3 percent of migrants moving for marriage, yet a notable 9.2 percent move for education.

Rural areas have a higher percentage of migration due to marriage at 68.4 percent, compared to urban areas (48.7 percent), excluding Kathmandu Valley urban (KVU). Urban areas outside KVU have more balanced reasons for migration, with 'following the family' at 27.0 percent and looking for work at 5.3 percent. The KVU stands out for its high percentage of migrants seeking work (18.9 percent) and education (13.7 percent), highlighting economic and educational opportunities.

### **8.5 Distribution of destination: from first out-migration from the birthplace**

Table 8.4 shows that for each province, the proportion of the population that never migrated, and for those who migrated, their first destination (province) from their birthplace. It shows that the first out-migration from birthplace occurs mostly within the same province.

### **8.6 Ratio of in-migrant population to total population by sex**

The ratio of the in-migrant population to the total population is 14.6, which is much higher for males at 18.8 compared to females at 10.8. Table 8.5 disaggregates it by province, analytical domains, urban/rural, and poverty status.

### **8.7 Origin of migration: last place before in-migration to current place**

For those who have migrated more than once, i.e., after moving from their birthplace, the survey asks about the last place the migrant was at before moving to the current place.

Table 8.6 shows the distribution of those in-migrant population (who have in-migrated to the place of interview) by the type of the last place they came from labelled 'origin' in the table. 85 percent of the population did not in-migrate in this situation, 6 percent came from 'Outside Nepal', 5 percent from urban and 3.5 percent rural areas. Table 8.6 further disaggregates it by province, analytical domains, urban/rural, and poverty status.

### **8.8 Duration of living among in-migrants**

In terms of duration of living/stay in the current place (place of interview) since moving from the last place, 41.2 percent of in-migrants have lived in their current location for 0-4 years, followed by 20.6 percent for 5-9 years, 13.6 percent for 10-14 years, and 24.5 percent for 15 or more years.

Poor in-migrants are more likely to have recently moved, with 47.8 percent having lived in their current location for 0-4 years, compared to 40.3 percent of non-poor in-migrants. Non-poor in-migrants have a higher percentage of long-term residence, with 25.3 percent living for 15 or more years, compared to 19.1 percent of poor in-migrants. These highlight economic factors influencing the stability and duration of migration.

## 8.9 Reason for in-migration to current place

The predominant reason for migrating from the last place of living/residence to the current place is “return home”, accounting for 44.1 percent of the in-migrant population in the country (Table 8.8). This is followed by those who follow their family (16.5 percent), while other significant reasons include marriage (8.4 percent), looking for work (6.9 percent) and seeking an easier lifestyle (6.2 percent). Within the provinces Karnali and Sudurpaschim, there are remarkably high proportions of in-migrants returning home, with figures at 59.1 percent and 59.5 percent.

**Box 8.1: Summary statistics of migration of population, 2003/04 - 2022/23**

## CHAPTER 9: ABSENTEES

### 9.1 Introduction

NLSS-IV collected information on absentees. This section intends to provide a comprehensive picture of absentees in Nepal. In this survey, absentees are those who are not currently household members and are most likely to be household members in the future. This section describes the determinants of absentees, the location of the absentees and socio-demographic characteristics. This chapter presents data on absentee population disaggregated by sex, age group, province, and urban/rural domains.

### 9.2 Absentees as a proportion of the total population

Overall, the male absentee population significantly overshadows the female population, with 73.2 percent of absentees being male compared to 26.8 percent female (Table 9.1). This disparity continues across all age groups, provinces, and urban/rural areas.

Figure 9.1: All ages absentees population, 2010/11 - 2022/23

The data for 2010/11 and 2022/23 indicate a declining trend in the proportion of absentees within the total population (including those residing abroad). Among the total population, the percentage of absentees in 2010/11 decreased from 20.3 to 16.9 percent in 2022/23 (Box 9.1). This decrease could be attributed to various factors, including improved economic conditions within the country or changes in migration patterns.

Looking at the age groups, the highest proportion of absentees falls within the 15-29 age group, followed by the 30-44 age group. While there are higher proportions of female absentees in the 0-4 and 5-14 age groups (Figure 9.2), the difference in proportions is still notable.

Figure 9.2: Percentage distribution of absentees with broad age group in NLSS, 2022/23

### 9.3 Absentees by place of current residence

In 2010/11, 56.9 percent of absentees were believed to be living within the country, while 43.1 percent were living outside the country. By 2022/23, this ratio had shifted to 48.4 percent within the country and 51.6 percent outside the country (Box 9.1). This shift shows a growing trend of international migration among Nepal's population, possibly driven by economic and employment opportunities abroad.

Looking at the urban/rural breakdown, urban areas (excluding Kathmandu Valley urban) have a considerably higher proportion of absentees believed to be living abroad (57.0 percent) compared to rural areas (38.0 percent). Kathmandu Valley urban again shows a distinct pattern with a significantly lower proportion of absentees living abroad (5.0 percent).

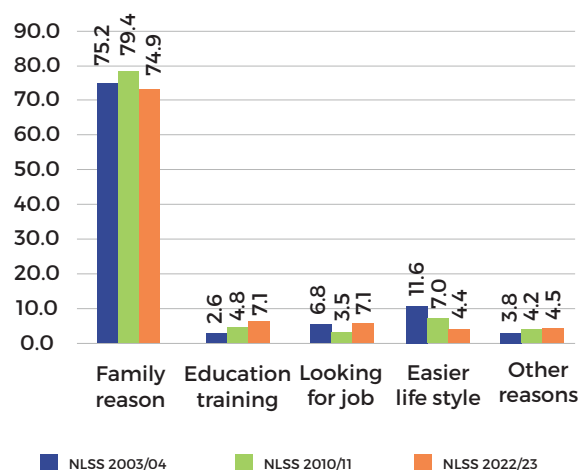

### 9.4 Absentees by reason

Table 9.3 shows the reasons behind the absentee population in Nepal. Primary reasons for absence are "working" (58.6 percent) followed by "study" (22.4 percent) and "family" (16.4 percent). This suggests that economic factors, such as working, studying, and family obligations, are the leading causes of absenteeism.

While the "working" reason is consistent across different regions, the "family" and "other" categories exhibit some regional variations. Kathmandu Valley urban stands out with a significantly higher proportion of absentees citing "working" (35.3 percent) (Table 9.3) as their reason, while the "family" reason is less prominent. This might reflect the economic opportunities available in the urban centres.

On the other hand, rural areas demonstrate a higher proportion of absentees mentioning "family" (28.0 percent) as their reason for absence, potentially indicating a greater role in family-related obligations.

Figure 9.2: Absentees by reason, 2003/04-2022/23

## CHAPTER 10: AGRICULTURE

### 10.1 Introduction

NLSS-IV incorporated an agriculture module to collect information on land holding and farming activities (land owned, land share cropped/rented/mortgaged-in, increase/decrease in holding area), production and use of crops, expenditure on agricultural input (including seeds/seedlings, fertilisers, pesticides, and hired labour), earnings/expenditure of farming, inventory of livestock on holding, earnings/expenditure of livestock, ownership of farming assets and access to extension services.

This chapter presents statistics on structural aspects of the agricultural sector in Nepal, focusing on agricultural holding. An agricultural holding is an economic unit of agricultural production under single management, including all livestock and poultry and all land used wholly or partly for agricultural production, without regard to title, legal form, or size. Some of the characteristics of agriculture holders are presented in this chapter. An agriculture holder is a person in the holding who exercises management control over the agricultural operations of the holding. The agriculture holder may or may not be the same person as the household head.

In the last 12 years since NLSS-III, agriculture has changed significantly. The percentage of households operating agricultural holdings and the average size of operated land has decreased. Among the farmers, the share of small farmers has increased. A summary of these critical indicators is presented in Box 10.1.

**Box 10.1: Selected agricultural indicators, 1995/96 – 2022/23**

Description	Nepal Living Standards Survey			
	1995/96	2003/04	2010/11	2022/23
Agricultural households (percentage of total house-holds)	83.1	77.5	73.9	60.3
Percentage of irrigated land area	39.6	54.3	54.4	49.4
Average size of agricultural land (in hectares)	1.1	0.8	0.7	0.4
Average number of parcels	3.8	3.1	2.9	2.8
Holdings operating less than 0.5 hectares (percentage of total holdings)	40.1	44.8	52.7	88.5
Percentage of holdings operating on 'renting-in-land' only	4.8	7.3	5.4	18.4
Percentage of holdings growing main paddy	76.0	76.1	72.3	64.3
Percentage of holdings growing summer vegetables	35.6	60.8	68.8	39.3
Percentage of holdings with cattle	73.5	66.6	64.2	37.8
Percentage of holdings with poultry birds	49.9	52.7	53.6	43.9

The percentage of agriculture households has gradually decreased, continuously dropping since 1995 and dropping from 73.9 percent in 2010/11 to 60.3 percent in 2022/23. This indicates that primary livelihood shifted away from agriculture. Similar is the case with the average size of agricultural land, which has also declined consistently, from 1.1 hectares in 1995/96 to just 0.4 hectares in 2022/23. On the other hand, the proportion of holdings operating less than 0.5 hectares has been increasing consistently, from 40.1 percent in 1995/96 to 57.1 percent in 2022/23. This trend indicates fragmentation of landholdings, resulting in potential challenges for efficient agricultural practices and difficulties in achieving economies of scale.

While paddy cultivation remains prevalent, the percentage of holdings growing main paddy has declined, indicating a shift towards other crops. The percentage of holdings growing summer vegetables has fluctuated over the years, indicating potential changes in market demands and agricultural practices.

Fewer agriculture households are keeping livestock in 2022/23. The percentage of holdings with cattle has significantly declined, from 73.5 percent in 1995/96 to 37.8 percent in 2022/23. This indicates a sharp decline in livestock farming, potentially due to factors like changing market conditions or urbanisation.

## 10.2 Characteristics of Agriculture Household Head

The agricultural household head refers to the person (male or female) in the household who has primary authority and responsibility for household and managing agricultural activities and is acknowledged as head by other household members. Most households in Nepal are farm households, and about 60 percent of the total households are agriculture households. Among them, more than one-third of agriculture households are female-headed (Table 10.1).

About 67 percent of agricultural household heads are literate, which is slightly lower than the literacy rate of all household heads in the country. The literacy rate of the agricultural household head is the lowest in Madhesh province (56.6 percent) and the highest in Gandaki province (77.1 percent). The literacy rate of agriculture household heads increases sharply from 54.2 percent in the bottom household consumption quintile to 83 percent in the top quintile.

The median age of females in a female-headed household in the country is 40 years compared to 46 years for agricultural household heads in the country.

## 10.3 Distribution of Agriculture Household (Holding)

Out of the total households in the country, 60.3 percent of households are engaged in agricultural activities (Table 10.1). When examined by province, the percentages vary significantly, with Karnali (82.2

percent) and Sudurpaschim province (81.6 percent) having the highest proportions, while Bagmati has the lowest at 41.6 percent. Rural areas generally have a higher percentage of agricultural households than urban areas. Bagmati Rural has 90.2 percent, whereas Bagmati Urban (excluding Kathmandu Valley urban) has 56.2 percent. Kathmandu Valley urban has the lowest percentage among all categories at 16.5 percent. The poorest quintile has the highest percentage of agricultural households at 73.9 percent, which steadily decreases with higher consumption quintile, with the richest quintile having only 42.2 percent. Additionally, households categorised as poor are more likely to be engaged in agriculture (73.9 percent) compared to non-poor households (57.6 percent) (Table 10.1). Rural areas, poorer households, and Karnali and Sudurpaschim provinces have a higher proportion of households engaged in land and livestock agriculture. Urban areas, households with higher consumption quintiles, and Bagmati province have a higher proportion of non-agricultural households.

## 10.4 Land Ownership

Table 10.10 shows data on land ownership in Nepal, categorised by ownership type (single or joint) and the sex of the single owner. Across Nepal, 96.4 percent of land is sole ownership of the household/household head/members, with the remaining 3.6 percent in joint ownership. Among those owned solely, 75.8 percent are male-owned and 24.2 percent female-owned.

Karnali province has the highest percentage of single land ownership (99.1 percent), with the lowest in Bagmati province (92.2 percent). Male ownership predominates in all provinces, with the highest male ownership in Karnali (85.8 percent) and the lowest in Madhesh province (67.3 percent).

Urban and rural distinctions reveal that rural areas have a slightly higher rate of single ownership (96.6 percent) than urban regions (96.7 percent). In urban areas, Kathmandu Valley urban (KVU) has the highest joint ownership rate at 10.4 percent, while in rural areas, the highest male ownership is in Karnali Rural (86.6 percent).

The data shows a predominant trend of male-dominated single land ownership across different regions, urban and rural areas, consumption quintiles, and poverty statuses in Nepal.

## 10.5 Land Fragmentation and Farm Size

Small-scale landholdings are prevalent in Nepal, especially in urban areas and among households from higher consumption quintiles, while rural areas and poorer households tend to have more varied land sizes (Table 10.4). Most agriculture households (57.5 percent) possess less than 0.1 hectare of land. Bagmati province (70.7 percent) and Madhesh province (66.5 percent) have the highest percentages of small (0.1 ha) landholders, while Karnali and Sudurpaschim provinces exhibit more diverse land

distributions, with significant proportions of households holding between 0.25 and 1.0 ha. Urban areas, particularly Kathmandu Valley urban (KVU), predominantly have small landholdings (92.6 percent with less than 0.1 ha), whereas rural areas show a broader range of land sizes. Regarding consumption quintiles, the poorest households are more likely to have larger land sizes than the richest, who primarily have smaller landholdings. Similarly, poor households have a slightly lower percentage of very small landholdings than non-poor households.

Average number of parcels per agricultural household in Nepal is 2.8 (Table 10.3). Karnali province has the highest 4.1 parcels per household, followed by Sudurpaschim and Lumbini province, with three parcels. Koshi and Bagmati provinces have the smallest average number of parcels, 2.1 and 2.4, respectively.

Rural areas generally have more parcels per household than urban areas. Karnali province's rural households have 4.9 parcels on average, the highest among all domains, while urban areas like Koshi province urban and Kathmandu Valley urban (KVU) have the lowest average number of parcels (1.9).

## 10.6 Land Tenure

Rural areas and poorer households tend to own more land, while households in higher consumption quintiles and urban areas show more practice of land renting activities. Table 10.5 shows the distribution of households that own agricultural land, rent out, and rent-in. Renting out means the household has rented the land out to someone, and rent-in means they are working on others' land. About 63.6 percent of households own their agricultural land, 17.9 percent of households have rented out, and 18.4 percent of households are renting in. Among the provinces, Karnali and Sudurpaschim provinces have the highest percentages of land ownership at 84.5 percent and 84.3 percent, respectively. In contrast, Bagmati and Madhesh provinces have the lowest land ownership rates at 52.0 percent and 51.2 percent, respectively, but higher renting-out (23.3 percent and 23.6 percent).

Rural areas exhibit higher land ownership compared to urban areas. Rural areas in Karnali and Sudurpaschim province have very high ownership (94.5 percent and 91.7 percent respectively), with lower renting-out (7.9 percent and 6.8 percent). Urban areas, especially in Kathmandu Valley urban (KVU), have the lowest land ownership at 32.1 percent and the highest renting-out rate at 38.8 percent. When considering consumption quintiles, the poorest households have a relatively high land ownership rate at 66.0 percent and the highest renting-in rate at 25.8 percent. The richest quintile has the lowest renting-in rate at 9.5 percent, despite a substantial land ownership rate of 60.0 percent. Interestingly, the richest quintile also has the highest renting-out rate at 35.0 percent, indicating a more active engagement in land leasing.

## 10.7 Major Crops

Table 10.7 shows diverse agricultural practices in Nepal, reflecting economic and socio-cultural variations in crop cultivation. It highlights the prominence of staple crops like paddy, wheat, and summer maize across different provinces and urban\rural areas alongside the cultivation of various vegetables and other crops.

Main paddy is the most widely cultivated crop, with 64.3 percent of households cultivating it, followed by summer maize (51.3 percent) and wheat (48.1 percent). In Koshi province, a significant proportion of households grow summer maize (56.5 percent) and millet (24.3 percent) apart from main paddy (53.7%), while in Madhesh province, main paddy (78.6 percent) and wheat (69.4 percent) are dominant. Bagmati province has high cultivation of summer maize (69.8 percent), main paddy (59 percent) and millet (31.0 percent), whereas Gandaki province shows a substantial percentage of households growing summer maize (74.6 percent), main paddy (57.4 percent) and millet (49.0 percent). In Lumbini, main paddy (67.3 percent) and mustard (65.5 percent) are prominent, with Karnali and Sudurpaschim province focusing significantly on wheat (86.5 percent and 86.1 percent, respectively), with notable summer maize cultivation in Karnali province (81.0 percent).

## 10.8 Improved Seeds

Table 10.8 outlines the usage of improved seed varieties across various crops in Nepal. Overall, 28.4 percent of households use improved seeds. For specific crops, improved seeds are observed in main paddy (54.4 percent) and early paddy (49.9 percent), with winter potatoes also showing a high used rate at 59.8 percent (Table 10.9). Wheat and spring/winter maize also have considerable usage of improved seeds, with 38.4 percent and 42.8 percent, respectively. Leguminous crops like green gram (35.3 percent) and grass pea (41.5 percent) show moderate use of improved seeds, whereas crops such as lentils (20.0 percent) and cowpea (19.7 percent) have lower percentages. Mustard seed has 15.6 percent, while other oilseeds like linseed (26.6 percent) and groundnut (20.5 percent) are also significant. Vegetable crops show a significant use rate, with winter vegetables at 49.8 percent and summer vegetables at 41.8 percent.

## 10.9 Use of Fertiliser

Table 10.16 shows variation in fertiliser usage, with certain provinces like Madhesh and urban areas like KUV having higher percentages of fertiliser use across various crops than rural areas and provinces like Karnali and Gandaki. Additionally, households with higher consumption quintiles use more fertilisers across most crops.

Around 57.4 percent of households use fertilisers for main Paddy, the highest among all crops, while the lowest usage is for millet at 6.0 percent (Table 10.17). 33.8 percent of households use fertilisers for

wheat, 29.9 percent for summer maize, 2.2 percent for summer potato, 19.6 percent for winter potato, 11.4 percent for mustard, 9.2 percent for summer vegetables, 13.1 percent for winter vegetables, and 4.2 percent for lentil respectively.

## 10.10 Livestock and Poultry

Table 10.14 shows agricultural households in Nepal that own various types of livestock and poultry. Goat ownership is the highest at around 61.0 percent, followed by poultry at 43.9 percent, cattle at 37.8 percent, and buffalo at 33.5 percent. Pigs, sheep, and other livestock have lower ownership rates at 10.8 percent, 2.1 percent, and 1.3 percent, respectively.

Agriculture households of the Koshi province have cattle (61.0 percent) and goats (66.5 percent), while Madhesh province has the highest buffalo ownership (34.0 percent) and significant goat ownership (63.2 percent). Agriculture households of the Bagmati and Gandaki provinces show balanced ownership of buffalo, poultry, and goats, with Gandaki province having particularly high buffalo ownership (48.9 percent). Lumbini and Sudurpaschim provinces also have considerable livestock ownership, especially for goats and poultry. Karnali province stands out with the highest cattle ownership (68.6 percent) and a notable presence of sheep (14.0 percent).

Urban areas (excluding the Kathmandu Valley urban) show significant ownership of goats (60.4 percent) and poultry (41.5 percent), whereas rural areas exhibit higher ownership across all livestock types, particularly cattle (42.9 percent) and goats (65.1 percent). In the Kathmandu Valley urban, poultry ownership is the highest at 31.6 percent.

Ownership patterns across consumption quintiles reveal that poorer households tend to have higher livestock ownership, particularly cattle (46.6 percent) and goats (62.5 percent). Conversely, households with higher consumption quintiles have lower ownership rates, although goats remain relatively common (50.5 percent).

# CHAPTER 11: Consumption

## 11.1 Introduction

For measuring welfare, countries mostly adopt a consumption-based or an income-based measure depending on how they think poverty needs to be defined and measured in the country context, including the feasibility of measuring and collecting data. Consumption measures ‘actual’ welfare by measuring the ‘actual’ use of goods and services as opposed to income, which measures ‘potential’ welfare<sup>1</sup>. A concept of well-being based on consumption is well suited to contexts where material deprivation is a concern, and measuring income is unfeasible due to the prevalence of self-employment and informal work or seasonality<sup>2</sup>. Low and lower-middle-income countries almost universally use consumption-based measures<sup>3</sup>. Since the initiation of the NLSS in 1995-96, Nepal has also been employing a consumption-based measure of welfare to monitor the poverty and well-being of Nepalis.

## 11.2 Consumption aggregate

The NLSS IV administered in 2022/23 provides Nepal’s latest estimates of poverty and well-being. The data is used to create a consumption aggregate that assigns a monetary value (in rupees) to the consumption of a set of essential food and non-food items that are important to the well-being of a household. The method follows the guidelines presented by Deaton and Zaidi (2002)<sup>4</sup>, and incorporates the current international best practices. A more in-depth methodological description of the construction of welfare aggregate and poverty estimation is provided in a technical note authored by NSO and The World Bank.

The consumption expenditure aggregates two main components: (i) food consumption expenditure and (ii) non-food consumption expenditure.

### 11.2.1 Food consumption expenditure

The survey asked each household the quantities consumed and monetary value of their consumption for over 100 food items (section 5 of the questionnaire), separately for items (i) produced at home, (ii)

4 Deaton, Angus; Zaidi, Salman. Guidelines for constructing consumption aggregates for welfare analysis (English). Living standards measurement study (LSMS) working paper, no. LSM 135 Washington, D.C.: World Bank Group. <http://documents.worldbank.org/curated/en/206561468781153320/Guidelines-for-constructing-consumption-aggregates-for-welfare-analysis>

purchased in the market, and (iii) received in-kind, over the past seven days before the interview date. Details on meals consumed outside the home in the last seven days were also recorded in a separate module for everyone in the household. These weekly consumption values over all items are annualised and aggregated to get estimates of annual household expenditure.

### 11.2.2 Non-food consumption expenditure

The annual non-food consumption expenditure is the sum of household expenditures in the past 12 months on (a) non-food non-durable items, including utilities, (b) consumption flow from durable goods<sup>5</sup>, and (c) the cost of housing services. The method to estimate the flow of services from durable goods and housing was improved based on the current best international practices.

### 11.2.3 Non-food non-durable items

The NLSS-IV records detailed information on (i) non-food non-durable frequent and infrequent used items, categorised into fuels, apparel and personal care, other frequent expenditures (such as education, wages for regular services), infrequent expenses (such as wages for repair work), and other miscellaneous expenses (such as insurance and financial services), (ii) education expenses, (iii) cost of utilities (such as electricity, gas and water), that are welfare enhancing consumption expenditures and often discretionary. The annual consumption value of the aggregate household spending on these non-food, non-durable items over the year before the survey forms one component of the non-food component of the welfare aggregate.

### 11.2.4 Durable items

Durable goods are distinct from non-durable goods in the fundamental characteristic of their 'durability'. A durable good delivers useful services to a consumer through repeated use over an extended period, which typically exceeds the reference period of the year preceding the survey. It is a lumpy/valuable item (such as a car/motorbike) that gradually loses value over its lifetime (depreciation) with its use. However, we rarely observe the cost or value of usage, but only the price paid at the time of its purchase.

Since the welfare aggregate reflects household consumption over the past one year from the time of survey, only the 'value of services' that a household receives from the possession of the durable goods during that year is added to the non-food aggregate. Following international best practices, a standard approach is used to ascertain the 'user cost' of durable goods in the reference period. The user cost is the cost a household is willing to pay to use the durable good over the year preceding the survey, that is, the monetary benefit forgone from not selling the durable item.<sup>6</sup>

<sup>5</sup> Non-food durable goods include household items, such as fans, refrigerators, and cars, that are typically used by households over many years. Thus, a use value over the past one year is estimated for these durable goods based on their age.

<sup>6</sup> The household has two choices. One, the household can hold the durable good till the end of the year, which will have a certain value adjusted for year's inflation and the depreciation over the year. Two, the household could instead sell the durable good at the beginning of the year and earn an inflation adjusted interest rate on this value over the year. The difference between the two options accounts for the forgone value that is estimated using the described approach.

To estimate the consumption flow from durables, the method proposed by Deaton and Zaidi (2002) is used to leverage information from Section 6C of the survey questionnaire on the list of durable goods owned by the household, the number of each item owned, the year of purchase of the last acquired item, the price at which the last item was purchased, and the estimate of their current sale value.

For each durable asset ( $i$ ) owned by the household, the per-unit purchase value ( $V_{i0}$ ) of the asset is obtained in current (2022-2023) prices by using the Consumer Price Index (CPI) data available from the Nepal Rastra Bank (Central Bank of Nepal) from 1972-73 to 2022/23.<sup>7</sup>

Next, the item-specific depreciation rate  $\delta_i$  based on the age of the asset in the year ( $a$ ), the purchase value ( $V_{i0}$ ) and the estimated current value ( $V_{it}$ ) is given as

$$\delta_i = 1 - (V_{it}/V_{i0})^{1/a}$$

As a final step to estimating the consumption flow from durable goods, age-group and item-specific weighted median depreciation rate ( $\delta_{im}$ ) is estimated at the national level. For a more precise estimation of median depreciation rates, the current approach contrasts with the 2011 approach on three counts: (i) weighted estimates of median depreciation rates are used instead of the unweighted medians, and (ii) negative depreciation rates are dropped when estimating medians.<sup>8</sup> and (iii) depreciation rates are calculated for items by age rather than only at item level. While the weights do not alter the estimates, the latter updates affect the value of consumption flows from durables. Instead of a constant depreciation rate for every asset, the depreciation rate is lower for households who own older items.

## 11.2.5 Housing

Given the size of its investment, the expenditure on housing is the most valuable durable goods and, therefore, a key component of the consumption aggregate (Mancini and Vecchi, 2022)<sup>9</sup>. Like any other durable asset, a home, once purchased, gives utility to the household over many years that typically exceed the survey period. The aim is, therefore, to estimate the flow of housing services in the year preceding the survey. Unlike other durable goods, rental markets for housing exist, and the rent paid most precisely captures the market value of occupying the house and is the correct measure of the flow of housing services.

Section 2 of the questionnaire asks for details on the actual rents from renters and the owner's self-reported estimate of the rent value of their dwelling had they rented it. However, assigning households' guess estimation of the rental value for households who own their dwelling or those who are occupying the dwelling free of charge is a challenge. Owners may incorrectly estimate rental values, especially in

<sup>7</sup> The reported per-item purchase price is multiplied by the conversion factor  $CPI_t/CPI_0$  to obtain the purchase value in 2022/23 prices. Moreover, since the survey module only asked the purchase details of the last purchased item for every asset, it is assumed that all items were bought at the same value and in the same year as the last purchased item.

<sup>8</sup> It is unlikely that assets considered as durable goods here will appreciate over time. In estimating the medians, therefore, we restrict to median among the positive depreciation rates.

<sup>9</sup> Mancini, Giulia; Vecchi, Giovanni. On the Construction of a Consumption Aggregate for Inequality and Poverty Analysis (English). Washington, D.C.: World Bank Group <http://documents.worldbank.org/curated/en/099225003092220001/P1694340e80f9a00a09b20042de5a9cd47e>

areas with thin rental markets. A standard approach is to use a hedonic model that leverages observed rents from renters and self-assessed rental values from owners to price various characteristics of their dwelling (size, amenities, construction material, etc.) to impute rents for non-renters. Moreover, housing markets may be different across geographies. For instance, the owners and renters in Kathmandu may be different from those in rural areas. One approach is to use a different hedonic model for each region. Another approach is to estimate a national hedonic model with PSU fixed effects, the lowest administrative unit level available to account for geographical differences in housing markets or any other PSU-level characteristics. The first approach was followed in the 2011 poverty analysis, where a separate regional hedonic model was estimated for Kathmandu and other urban and rural areas.

Among several models, both the national and regional models were tested for both the renters' and owners' samples. The best model was chosen such that (i) the predicted value of rent is close to that reported by renters (graphical inspections using residual plots), (ii) the R-squared is high, and the Root-mean squared error (RMSE) is minimised.

The national regression model with PSU fixed effects gives the best fit of the data for renters, partially due to the large sample size used for predictions, justifying the final choice of using a national hedonic regression to impute rents for owners. While splitting the sample into three different regional models does not result in much poorer R-squared or RMSE, the larger sample size with a national model is an improvement, especially for rural areas where the sample of renters is low. The specification used is as follows:<sup>10</sup>:

$\ln(\text{rent})_{ij} = f(\text{dwelling characteristics}_{ij}, \text{value of assets}_{ij}, \text{geographic FE}_j, \text{regional renter status}_{ij}, \varepsilon_{ij})$ ; where subscript  $i$  is for a household  $i$  in a PSU  $j$ .

As a final step in constructing the welfare aggregate, to obtain a comparable measure of per capita consumption expenditure over time and across different regions, the consumption expenditures are adjusted to account for price variations across three seasons and analytical domains. The temporal and spatial price index (deflators) aggregate the differences in prices of goods and services for households interviewed across locations and time into a single metric. These deflators, therefore, represent the price differential between different points in time and across locations. Details of these adjustments are provided in the detailed technical/methodological note on poverty estimation, where nominal and real values are used. Below, nominal values are discussed

### 11.3 Distribution of nominal per capita consumption

Table 11.3 presents the average annual nominal per capita consumption derived from the abovementioned method. As of 2022/23, Nepal's average annual nominal per capita consumption

<sup>10</sup> A more in-depth methodological description of the construction of welfare aggregate and poverty estimation is provided in a technical note authored by NSO and The World Bank. See the paper for details on variables used.

is Rs. 130,853. It also shows variation between the richest to poorest quintiles, whereby the richest 20 percent of the population consumes 4.4 times more than the poorest twenty percent. Table 11.3 also shows the average annual nominal per capita expenditures for the 15 analytical domains from NLSS-IV. It is highest in Kathmandu Valley at Rs. 263,318 in 2022/23 rupees. Gandaki Urban has the second highest consumption of Rs. 176,542 per person per year, which is 67 percent of the average consumption in Kathmandu Valley. The lowest average annual nominal per capita expenditures are in Madhesh Rural and Sudurpaschim Rural at Rs. 71,828 and Rs. 72,861 per person per year, respectively. While Table 11.6 presents annual per capita expenditures by deciles, table 11.1 shows the population distribution by per capita consumption quintile.

## 11.4 Distribution of nominal household consumption

Table 11.2 provides nominal household consumption and its distribution by expenditure category. The table presents expenditure shares on each province's food, rent, education, and other non-food items, analytical domain, poverty status, and quintile consumption. The annual nominal household consumption for the country is estimated at Rs. 523,413 in 2022/23. Almost 52 percent of this is on food consumption, where the share varies by consumption quintiles (the richer the population, the lower the share of food in consumption). Table 11.4 provides the average per capita food share by consumption quintile and poverty status. Table 11.5 provides total nominal household consumption (NRs. billions) for each province, analytical domain, and country across the consumption quintile.

Poorest 20% of population	-	27.0	28.4	40.6
Richest 20% of population	-	59.9	54.2	56.3

\*Unlike in the previous two surveys, the consumption in 2010/11 and 2022/23 has been calculated based on the last seven days consumption of the household.

## CHAPTER 12: INCOME

### 12.1 Introduction

Income, as defined in this survey, measures the flow of financial resources available to the household over the past 12 months from various sources. These financial resources, along with other available resources such as credit, contribute to the household's living standards. This chapter outlines the methodology used to construct household income aggregates, and examines income levels, sources, and distribution.

### 12.2 Construction of Income Aggregate

The method of constructing income aggregates for the NLSS-IV is similar to the method used in the NLSS-III as documented in NLSS-III's the detailed statistical report. Like in NLSS-III, the main components of household income are: crop income, non-crop farm income, income from wage employment, income from non-farm enterprises, valuation of housing consumption of own dwelling, income from remittances, rental income, and income from other sources. In each component income is calculated as revenues net of costs. The components of total household income are listed in Box 12.1.

**Box 12.1: Components of household income**

Main Component	Items to Add	Items to Deduct
Farm Income	+ Value of total crop production (net of share paid to landlord)	- Cultivation costs (seeds, fertilizers, hired labour, irrigation etc.)
	+Value of by-product production	- Maintenance expenditures on farm machinery and buildings
	+Net income from renting farm assets (draft animal, tractor, thresher etc.)	- Expenditure for the purchase of livestock
	+Value of sales from non-crop farm production (milk, ghee, eggs etc.)	- Fodder and other livestock expenditure (veterinary services)
	+Earning from the sale of livestock	- Cash rent paid to landlord on land leased-in
	+Value of home -produced non-crop consumption	
	+Total cash and in-kind received from tenants on land leased-out	
Wage Income	+Value of cash and in-kind earning per year (includes daily, long-term and piece-rate/contract)	
Non-farm Enterprises Income	+Gross income from non-agriculture enterprises/activities during past 12 months	- Wage paid both cash and in-kind
		- Energy expenditure

		- Expenditure on raw material
		- Other operating expenditure
		- Share of net revenues paid to partners (or kept by partners)
Non-agriculture Rental income	+Income from renting out non agriculture property	
	+Income from renting out non agriculture assets	
Remittance income	+Remittances received (cash and in-kind)	- Amount sent (cash and in-kind)
Owner-occupied housing	+Imputed rental value of housing which otherwise would have to be paid to purchase housing services	
Other Income	+Interest, dividends, profit earning from shares and savings/deposit accounts	
	+Social security payment	
	+Pension income (domestic and foreign)	
	+Commission fees and royalties, other incomes	

### 12.2.1 Farm Income

Crop income: The gross values of crops harvested are calculated from section 11B of the questionnaire, which provides information on quantity harvested, quantity sold and unit selling price for each crop. This calculation involves the following steps:

- First, the unit selling price reported by the household is used to evaluate the total production. However, not all harvested quantity is sold. In several cases, either a small share or none of the harvested amount is sold in the market. This necessitates price imputations for harvested crop that is not sold.
- For cases where unit selling prices are not available, median values are imputed at progressively higher levels of aggregation. There are three such levels: analytical domain, urban/rural and national. It starts at the domain-level and the process is continued iteratively using urban/rural-level and national-level imputed values. The calculation excluded the cluster level due to limited number of observations within cluster for each crop making it impractical to impute the values.
- Imputation of missing prices for bamboo, buckwheat, black grams and some cereals and lentils turned out to be problematic because the harvested quantity and selling prices were reported in different units for some observations. With no plausible options available for imputation, such cases were dropped.

- For those households who are renting-in land in-kind payments to the landlord are deducted from the total harvested quantity. The harvested values (net of in-kind rent payments) are aggregated across all crops for each household to obtain a household-level estimate from gross agricultural output per farming household.

Gross agricultural output value is generated by combining income with other agriculture earnings and expenditure data. Income from selling of agriculture by-product and renting out of draft animal, tractor, thresher, other machinery and other income (from section 11D1) are added to gross agricultural output while expenditures on seeds, fertilizers, hired labor, irrigation, and renting in of above items (from sections 11. C1, C2, C3, D2) are deducted from the gross agricultural output. Total crop income thus is gross agricultural output plus net income from this.

**Income from livestock:** Section 11E contains information on income and expenditure from livestock and its byproducts. This includes data on the purchase and sale of cows, buffaloes, goats, yaks, poultry, and other livestock; earnings from sales of milk, ghee, eggs, meat; and expenditures on animal feed, transportation of feed, veterinary services. Income from livestock is calculated as total value of sold livestock minus total value of purchased livestock plus net income from livestock byproducts based on the data above.

**Consumption of home-produced non-crop goods:** Section 5 contains information on food expenditures and home production. Home-produced non-crop goods – such as eggs, milk, ghee, fish, mutton, buffalo meat, chicken and other meat - are valued and aggregated to generate a value of home-produced non-crop consumption.

**Land rent income:** Section 11A1 provides information on cash and in-kind received from renting-out cultivation land to a tenant, while section 11A2 gives information on rent paid in cash (in-kind payment has already been deducted from gross agricultural output) to a landlord for renting-in land for crop cultivation. Net income calculated from these two sections is then added to household's aggregate farm income.

### 12.2.2 Wage Income

The details of wage employment activities are collected in section 10. This section collects wages received by an employee in each activity either on daily, long-term or contract/piece-rate basis.

**Daily wage income:** Daily wage income is calculated as cash received per day plus value of any in kind received per day multiplied by number of days worked in that particular activity, plus value of in-kind payments for the whole period.

**Long-term wage income:** Long-term wage is calculated as payment on salary, transportation allowance, bonuses, clothing and any other allowances received yearly from each work activity.

**Piece-rate/contract income:** Piece rate or contract basis wage income is the total of cash and in kind received yearly by individual per each work.

For each individual wage earner in the household, daily income is annualized and then aggregated for long term and contract-based income to obtain annual wage income. Wage income figures for every earner are then aggregated at the household level to obtain total wage income to each household.

### 12.2.3 Non-farm Enterprises Income

Information on household enterprises either solely owned or in partnership, comes from section 12. Net revenues from each household enterprise or the share owned by the household (if the household members are not sole owner of the enterprise) are aggregated to get annual non-farm enterprises income for each household.

### 12.2.4 Non-agricultural Rental Income

Rental income received by households from renting-out residential property, land property and other real assets comes from section 13.C and section 2C. This constitutes non-agricultural rental income.

### 12.2.5 Transfer Income

Remittances received by household member (as cash or in-kind) are reported in section 14 and section 15B respectively. The remittance sent out from households from section 14 and 15A is deducted to get the net remittance amounts received by household during the past 12 months. They are aggregated for each recipient household.

### 12.2.6 Value of Owner-occupied Housing

If a household lives in a housing unit it owns or for free, this consumption needs to be included in income as home-produced consumption. The value of such consumption is the reported rental value that would have to be paid if someone wanted to rent it. When such reported values are missing or implausible, they are replaced with regression-based imputed rental values.

### 12.2.7 Other Income

The remaining sources of income are compiled in section 16. These include earnings from social assistance, savings or fixed account deposits, shares/stocks, treasury bills, employee provident fund/citizen investment fund, internal/external pension, commission fee, royalties etc. All these income amounts are aggregated at the household level.

## 12.2.8 Total Income

The aggregate household income is finally obtained by summing income from sources described above: farm income, wage income, non-farm enterprises, non-agricultural rental income, net remittance received, owner occupied housing consumption and other income components. Per capita income is obtained by dividing household income by household size.

## 12.2.9 Items Omitted from Income Aggregate

**Net interest income:** Flow of resources from interest earnings from money lent to others is difficult to calculate for three reasons: NLSS does not have separate questions to distinguish between interest payments and principal repayments; between outstanding principal amounts and interest amounts; rolled over or extended loans may not involve actual transfer of payments even when a household reports a positive interest rate on the amount. Because of these difficulties net interest income is excluded from the computation of total household income.

**Farm machinery and housing property:** Income from sales of farm machinery is not included in total income because they represent investment or disinvestment of assets rather than current income (household whose income source is trading of agriculture machinery would be included in enterprise section). Net proceeds from sale and purchase of housing or land-property are considered as changes in assets and not included in total income. Similarly, expenditure on improvement of land or building and repair and maintenance of agricultural equipment are also excluded because the reported values tend to denote investment flow and not income flow. In kind social assistance: Monetary equivalent of in-kind benefits received from in-kind social security programs or cash received from public works (cash for work) programs are not included as NLSS doesn't ask questions to capture this information.

## 12.3 Levels, Sources and Distribution of Income

### 12.3.1 Levels of income

The nominal mean and median household annual income in 2022/23 is Rs. 551,148 and Rs. 383,389 respectively (Table 12.1). Nominal per capita mean and median stand at Rs. 136,707 and Rs. 92,636 respectively. One percent each of both ends of the per capita income distribution, 2 percent of all households -- are defined as outliers and excluded from the analysis. All subsequent tables are based on data without the outliers.

Bagmati province has the highest mean household income and the highest per capita income while Karnali and Sudurpaschim provinces have the lowest mean household incomes. Bagmati and Gandaki urban areas lead in income, along with Kathmandu Valley urban. In contrast, rural areas in provinces

like Karnali and Sudurpaschim report lower figures. Table 12.1A also includes own account production. Table 12.2 and table 12.3 shows shares of remittance received in total income of recipient households by quintile and by country, respectively.

### 12.3.2 Income sources

Wage income is the largest single contributor to household income in Nepal in 2022/23, comprising over one-third of the total income (Table 12.4). Despite being the second-largest source of income, farm income makes up less than one-fifth of the total. Remittances are nearly as important as farm income (16.5%), reflecting the crucial role of money sent from abroad or from urban to rural areas in sustaining households. Earnings from non-agricultural enterprises contribute over 10% of household income.

Wage income is the dominant source in most provinces, especially in Bagmati (39.32%) and Madhesh (40.06%), indicating a strong employment sector. However, farm income remains crucial in provinces like Karnali (26.13%) and Sudurpaschim (25.91%). Net remittances are particularly significant in Lumbini (22.50%) and Gandaki (19.49%). Non-agricultural enterprise income is notably higher in wealthier and more urbanized provinces like Bagmati (12.89%) and Koshi (10.76%).

Across the consumption quintiles, there is a decreasing reliance on farm income and increasing income from non-agricultural enterprises and asset rentals as household consumption levels rise. Wage income remains a substantial source across all quintiles but slightly declines in proportion among wealthier households, who diversify their income more through business activities and property rentals. Remittances also play a significant role, particularly in the middle consumption groups. These trends highlight a shift from agriculture towards diversified income sources in wealthier households.

### 12.3.3 Distribution of income

Nominal income distribution among the population is shown in Table 12.6. The population is almost evenly distributed across all income quintiles, each representing about 20% of the total. However, significant differences exist at the provincial level. Bagmati and Gandaki provinces have the highest percentages in the richest quintile, at 37.95% and 35.38%, respectively, while Karnali and Sudurpaschim have the highest percentages in the poorest quintile, with 30.53% and 25.54%. Madhesh shows a high concentration in the lower income quintiles, with 28.21% in the poorest and 29.39% in the second quintile, and only 6.31% in the richest. Urban areas like Kathmandu Valley have a substantial proportion of their population in the richest quintile at 49.16%, whereas rural areas across provinces generally have higher percentages in the lower income quintiles, with 33.84% of Karnali Rural and 35.05% of Sudurpaschim Rural in the poorest quintile.

# CHAPTER 13: LABOUR AND EMPLOYMENT

## 13.1 Introduction

NLSS-IV introduced labour and employment module to collect information on labour and employment statistics with the current standard definition of employment adopted from the 19th International Conference of Labour Statisticians, ICLS. With these new concepts and definitions of employment, labour market indicators collected from previous NLSS are not directly comparable and concepts and definitions might differ.

## 13.2 Key labour market concepts

**Working-age population:** The working-age population comprises individuals aged 15 years and above. However, in NLSS-IV, the labour module is asked for individuals aged ten and above in the household and this age criteria is used as the working-age population for the estimation of labour market indicators. The total population of those aged ten and above falls into one of the three categories: employed, unemployed, and not in the labour force or outside the labour force.

**Persons in employment:** People of working age who, during a short reference period (7 days), were engaged in any activity to produce goods or provide services for pay or profit. This includes:

- a) Employed persons “at work”, i.e., those who worked in a job for at least one hour in the reference week
- b) Employed persons “not at work due to temporary absence from a job, or to working-time arrangements (such as shift work, flexitime and compensatory leave for overtime).

It indicates the relative size of the labour supply available to produce goods and services.

**Unemployed:** People of working age who fulfil three criteria simultaneously: completely without work, currently available to work, and taking active steps to find work.

**Labour force:** If a person is of working age and is working or trying to find work, he/she is in the labour force. Thus, the number of people who are employed plus those who are unemployed constitute the labour force.

**Outside the labour force:** A person who reaches working age may not necessarily enter the labour force. These individuals did not work in the reference week, either because they did not look for work, tried to start a business in the four weeks preceding the survey, or were not available to start work or a business in the reference week.

**Unemployment rate:** The unemployment rate measures the proportion of the labour force that is trying to find work.

**Labour force participation rate (LFPR):** The labour force participation rate is a measure of the proportion of a country's working-age population that engages actively in the labour market, either by working or looking for work; it indicates the relative size of the supply of labour available to engage in the production of goods and services, relative to the population at working age (ILO).

**Employment-to-population ratio:** The percentage of employed, called employment-to-population ratio, measures the proportion of the working-age population that is employed. The employment-to-population ratio is defined as the proportion of a country's working-age population that is employed. A high percentage or ratio means that a large proportion of a country's population is employed. In contrast, a low percentage or ratio means that a large share of the population is not involved directly in labour market-related activities, either because they are in unemployment or because they are out of the labour force altogether.

**Status in employment:** Status in employment details how the employed population are attached to the job and the type of authority over establishments. Status in employment classifies the job held by a person at a point in time concerning the type of explicit or implicit employment contract that person has with other persons or organisations. Such status classifications reflect the degree of economic risk entailed in these various arrangements, an element of which is the strength of the attachment between the person and the job and the type of authority over establishments and other workers that the person has or will have. (ILO)

In this report, the method of classifying employment by status is based on the 1993 International Classification by Status in Employment (ICSE).

Employment by sector disaggregates employment into economic sectors. The indicator shows employment growth and decline on a broad sectoral scale while highlighting differences in trends and levels between developed and developing economies. In this report, the sectors of economic activity are defined according to the International Standard Industrial Classification of All Economic Activities (ISIC), Revision 4 (2008).

Employment by occupation disaggregates employment into occupation groups. This report defines occupation groups according to the International Standard Classification of Occupation, 2008 (ISCO-08).

As mentioned, NLSS-IV implements the labour module for individuals 10 years and above. The tables at the end of the chapter provide descriptives on labour market indicators for two sets of the population – those 10 years and above and those above 15 years and above. The following section discusses key

labour market indicators for the working-age population of 15 years and above for the international standard.

### 13.3 Labour market indicators by provinces and poverty status

In 2022/23, the labour force participation rate of individuals 15 years and above is 37.1 in Nepal (Table 13.8). The unemployment rate for individuals 15 years and above is 12.6 in 2022/23 for the country.

Among provinces, Madhesh province stands out with the lowest unemployment rate at 5.5 percent, while Karnali has the highest unemployment rate at 23.8. The labour force participation rate also varies significantly across provinces, with Bagmati scoring the highest at 45.1 percent and Sudurpashchim the lowest at 27.9 percent, potentially influenced by the availability of opportunities in these places.

Labour market indicators by poverty status show significant differences between poor and non-poor groups overall and within provinces. Overall, in the country, the unemployment rate for the poor is 17.3 percent, substantially higher than the 11.7 percent for the non-poor. This disparity persists across all provinces, with Karnali province experiencing the highest difference (41.5 percent unemployment for the poor versus 19.8 percent for the non-poor). Similarly, labour force participation rates are consistently lower for poor individuals than their non-poor counterparts in every province. This highlights the unequal access to the labour market and the strong correlation between poverty status and labour market indicators.

### 13.4 Sex and labour market outcomes

The unemployment rate stands at 12.6 percent for both sexes, where males experience a lower rate of 11.3 percent compared to 14.7 percent for females (Table 13.9). This gap is further amplified by a considerable difference in labour force participation; 52.7 percent for males and only 24.4 percent for females. This trend of lower participation and higher female unemployment is consistent across all provinces. Madhesh province exhibits the largest difference, with a labour force participation rate of 54.9 percent for males and only 16.5 percent for females. These figures underscore gender-based barriers to employment.

### 13.5 Rural-urban differences in labour market outcomes

Nationally, 32.4 percent of the population is employed, 4.7 percent are unemployed, and 62.9 percent are outside the labour force, but going by analytical domains, the urban area of Kathmandu Valley has the highest employment rate (48.3 percent) and labour force participation rate (52.3 percent) (Table 13.10). Urban areas having higher employment rate and labour force participation is true for all provinces and is expected. Conversely, rural areas tend to exhibit lower employment and higher unemployment rates than their urban counterparts.

### 13.6 Labour market indicators by consumption quintiles

Table 13.11 provides a breakdown of labour market indicators by province and consumption quintile for individuals aged 15 years and above. The poorest quintile consistently exhibits the lowest employment rates and highest unemployment rates across all provinces. In contrast, the highest employment and labour force participation rates are in the richest quintile. Notably, Karnali province shows the most pronounced differences between the poorest (15.9 percent employed, 41.5 percent unemployment rate) and richest (43.3 percent employed, 6.2 percent unemployment rate) quintiles. In Sudurpaschim, the poorest quintile has an extremely low labour force participation rate (19.3 percent) and a high proportion outside the labour force (80. percent). Table 13.12 provides these estimates for the analytical domains as well.

### 13.7 Age and labour market outcomes

Among the four age categories (15-24, 25-44, 45-64, and 65+), those between the ages of 15 to 24 experience the highest unemployment rate (22.7 percent) (Table 13.13). The proportion of employed is the highest for those between the ages of 25 and 44 (46.2 percent), and labour force participation is also the highest for this group (52.2 percent). As expected, the oldest group (65+) shows the lowest proportion of those who are employed (7.8 percent) and labour force participation (8.5 percent). Interestingly, despite a low unemployment rate (8.0 percent), the 45-64 age group also has a low labour force participation (36.8 percent).

Across the provinces, Bagmati exhibits the highest overall employment rate (40.9 percent) and labour force participation (45.1 percent), driven by a strong performance in the 25-44 age group (57.8 percent employed, 63.2 percent participation). Conversely, Sudurpaschim province records the lowest employment (24.4 percent) and labour force participation rate (27.9 percent).

### 13.8 Education and labour market outcomes

Table 13.14 demonstrates the relationship between educational attainment and employment outcomes in the country and across different provinces. It shows a clear positive correlation between education level and labour force participation and employment rates, while inversely impacting unemployment rates.

Individuals with higher education levels consistently exhibit greater labour force participation and lower unemployment rates. Those with a bachelor's degree boast a 64.2 percent employment rate and around 6.3 percent unemployment rate. This trend escalates further with master's and above qualifications, reaching a 77 percent employment rate and a 2.6 percent unemployment rate. Conversely, individuals

with limited literacy or no formal education face considerably lower employment (20.5 percent), and most remain outside the labour force (77.3 percent). This summary table is also presented in Table 13.22. Similarly, labour force participation, which signifies the proportion of the population actively engaged in the workforce, exhibits a positive correlation with education. While only 22.7 percent of illiterate individuals participate in the labour force, this figure surges to 79 percent for those with a Master's degree or higher.

Conversely, unemployment rates decline steadily with increasing educational attainment. The unemployment rate for individuals with a Master's degree or above (2.6 percent) is significantly lower than the national average (12.6 percent) and substantially lower than that of individuals with less than basic education (12.6 percent).

### 13.9 Sectors of employment

Table 13.15 – 13.21 breakdown different employment indicators in relation to employment sectors. Table 13.15 shows employment by sector of the economy (agriculture vs. non-agriculture) and type of employment (paid vs. self-employed vs. unpaid work). This highlights non-agricultural employment's dominance and self-employment's prevalence, particularly in agriculture.

86.7 percent of employed individuals work in the non-agricultural sector, while only 13.3 percent work in the agriculture sector. This indicates a shift from traditional agricultural livelihoods to more diverse economic activities. Within the agricultural sector, self-employment is predominant, with only 10.4 percent engaged in paid agricultural work. In contrast, the non-agricultural sector shows a greater balance between paid (56.6 percent) and self-employment (22.6 percent).

Females are significantly more involved in unpaid household work (16.3 percent) compared to males (4.1 percent). Furthermore, while males dominate paid non-agricultural work (63.2 percent), females have a higher representation in paid agricultural work (16 percent).

These findings emphasise the evolving nature of the Nepalese labour market, with a growing non-agricultural sector and a persistent reliance on self-employment.

Table 13.16 shows a breakdown of occupations across seven provinces, categorised by major occupational groups and further differentiated by sex. This data provides valuable insights into the distribution of skilled and unskilled labour across the country and highlights gender disparities within specific occupational sectors.

Bagmati province emerges as a hub for professional and managerial roles, with 40.2 percent of managers and 30.7 percent of professionals concentrated in this region. Conversely, Madhesh province shows a higher concentration of individuals employed in elementary occupations (32.3 percent).

Across all provinces, some occupations exhibit significant gender disparities. For instance, females constitute a larger share of professionals (44.8 percent) and technical and associate professionals (44.2 percent) in Bagmati province compared to other provinces. This indicates greater female participation in these skilled roles within the Bagmati province.

Table 13.17 provides notable differences in occupational patterns by analytical domains, highlighting the influence of urbanisation and regional economic activities. Elementary occupations constitute the largest occupational group (27.1 percent) in the country, followed by service and sales workers (21.4 percent) and craft and related trade workers (18 percent). This pattern generally holds true for both urban and rural areas. However, urban areas tend to have a higher concentration of managers, professionals, and technical and associate professionals, reflecting the presence of more specialised and white-collar jobs in these settings.

Conversely, rural areas, particularly in Karnali and Sudurpaschim provinces, show a greater concentration of individuals engaged in elementary occupations (35.1 percent and 29.4 percent respectively), highlighting the prevalence of unskilled labour.

Table 13.18 presents the distribution of employed individuals aged 15 years and above across major sectors, categorised by the Nepal Standard Industrial Classification (NSIC), and disaggregated by province. This data highlights the concentration of specific industries within regions. Bagmati province remains dominant in several industries, including manufacturing (28.5 percent), trade & machine repair (30 percent), accommodation (45.8 percent), and others (40.4 percent). Madhesh province displays a higher concentration of employment in agriculture (33.6 percent) in contrast, Karnali and Sudurpaschim provinces show lower representation across most sectors, indicating limited economic diversification in the province.

The data also reveals interesting patterns in specific sectors. For instance, Gandaki province shows a relatively higher concentration of employment in accommodation (11.3 percent), potentially linked to tourism activities in the region. Similarly, education services are more concentrated in Bagmati (27.3 percent) and Lumbini province (17.7 percent).

Table 13.19 provides an insightful overview of the relationship between educational attainment, employment status, and the distribution of workers across different economic sectors in Nepal. The data demonstrates that higher levels of education correspond with a greater likelihood of being formally employed and working in more advanced sectors of the economy. As educational attainment increases, the proportion of paid employees rises considerably. While 59.5 percent of individuals with basic education are paid employees, this figure jumps to 73.8 percent for those with a Bachelor's degree and further to 88 percent for those with a Master's or above. This trend underscores the strong link

between education and access to formal employment opportunities. Conversely, self-employment and unpaid family work become less common as education levels rise, indicating a shift towards more secure and remunerative forms of employment.

The data also reveals a clear connection between educational attainment and the sectoral distribution of workers. Individuals with higher education levels are disproportionately represented in the tertiary sector. For instance, 86.8 percent of those with a bachelor's degree and 91.2 percent of those with a master's or above are employed in the tertiary sector. In contrast, those with lower levels of education are more concentrated in the primary and secondary sectors.

Table 13.20 examines the intersection of employment status (paid, self-employed, unpaid family worker), major industrial sector (primary, secondary, tertiary), province, and sex. Among those who are employed, paid employment is the most prevalent form of work (67.0 percent), followed by self-employment (24.5 percent) and unpaid family work (8.4 percent). The tertiary sector dominates the employment landscape, employing 54.4 percent of the workforce, followed by the secondary (31.9 percent) and primary sectors (13.7 percent).

Males are more likely to be paid employees (70.5 percent) compared to females (60.8 percent), while females are significantly overrepresented in unpaid family work (16.3 percent compared to 4.11 percent for males). This pattern suggests that women often bear a disproportionate burden of unpaid household labour.

Analysing sectoral distribution, the primary sector shows a larger share of unpaid family work (19.8 percent for females vs. 10.3 percent for males), reflecting the prevalence of family-based agricultural activities. Conversely, the tertiary sector demonstrates a greater proportion of paid employment for both males and females, although the gender gap in paid employment persists.

Paid employment is less common among the non-poor (64.1 percent) compared to the poor (84.2 percent). The poor also exhibit a lower reliance on unpaid family work (4.5 percent vs 9.1 percent). Looking at sectoral distribution, the tertiary sector attracts a larger proportion of non-poor workers (58.6 percent) compared to their poor counterparts (30.2 percent). Conversely, the poor show a greater concentration in the primary sector (26.1 percent vs. 11.5 percent). This pattern likely reflects the limited access to education and skills training for the poor, restricting their opportunities in the more specialised and higher-paying tertiary sector.

Box 13.1: Indicators on employment status, 1995/96 – 2022/23

Description	Nepal Living Standards Survey

# CHAPTER 14: WAGE EMPLOYMENT

## 14.1 Introduction

Wage refers to the financial compensation paid to employees for their labour or services. Wage employment status is defined as those who receive wages and salaries for their time spent at work. The remuneration is paid either in cash or kind (such as payment for food, clothing, etc.) or both. Remuneration of wage employment is not directly dependent on the revenue of the unit for which the person works. This remuneration is calculated hourly, daily or monthly, or on a contract basis.

This chapter presents wages on a daily, long-term (monthly) or contract (volume-based) basis. Wages can be taken as a key indicator reflecting the people's earning distribution and standard of living. Wage data help assess the impact of economic policies, inflation and market conditions on workers' earnings. Wage statistics are essential for policymakers to prepare strategies for improving employment conditions and promoting equitable economic growth. This chapter describes average wage employment days, the basis of work, remuneration, occupation-wise wage employment, and status by different categories of people aged 10 years and above based on NLSS-IV.

## 14.2 Number of days worked, remuneration, and basis of wage payment

The survey asks about wage employment in the last 12 months. Table 14.1 shows the average number of days worked, remuneration and basis of wage employment (daily, monthly and contract) for the country and across sex and provinces in the last 12 months. The results are presented on two main bases: short-term and long-term basis. A short-term basis means workers are hired for a short term, where remuneration is decided on daily rates.

For those working on a short-term basis, the average number of working days is 72 at the national level, while the lowest average number of working days is in Karnali province (38) and the highest is in Bagmati province (82), which is slightly higher than the national average. Bagmati province has the highest average daily cash wage earnings at 821 rupees, while Madhesh province has the highest daily in-kind wage at 113 rupees. In terms of total short-term earnings (yearly income from daily basis work, which is taken by multiplying the daily amount in rupees (cash and in-kind) with the total number of working days and then weighted), Bagmati province has 83,204 rupees, indicating a higher wage rate and more work available in this province.

For those employed on a long-term basis, earnings are included in two categories – those employed for a long term on a monthly salary basis (called wage long term in the table) and those who work for a fixed amount of time in a contract or a piece-rate basis. The average yearly earning for those in the first category is 2,90,682 rupees at the national level, with the lowest earning in Lumbini province (2,25,195

rupees) and the highest in Bagmati province (3,85,505 rupees). Similarly, the average yearly earnings for those working on a contract basis is 2,15,387 rupees at the national level, with the lowest average in Sudurpaschim province (87,535 rupees) and the highest in Bagmati province (3,22,327 rupees). Total yearly average earnings at the national level for all categories short and long-term is 1,32,625 rupees, where the lowest is in Karnali province (84,711 rupees) and the highest in Bagmati province (2,53,286 rupees). Bagmati province consistently shows the highest wages and earnings, reflecting its economic advantage, while provinces like Sudurpaschim and Karnali exhibit lower wage rates and earnings.

The table also shows a significant gap between males and females in terms of average working days and earnings. Nationally, males work an average of 91 days annually, 110 percent more than females, with an average of only 43 days. This gap replicates directly to earnings, with males receiving significantly higher annualised daily earnings (male 74,851 rupees vs female 24,518 rupees), followed by both in long-term wages (male 3,33,953 rupees vs female 2,07,477 rupees), contracts basis (male 2,60,832 rupees vs female 67,914 rupees) and total yearly income (male 1,67,483 rupees vs female 74,276 rupees). Madhesh province exhibits the most striking gender disparity in daily working days. Males in Madhesh province work 110 days annually, more than double the 41 days. A similar pattern is observed in all provinces for the average number of days and earnings, showing a significant gender gap.

Table 14.2 shows differences across different consumption quintiles for the same variables. The data show a clear trend of increasing earnings with higher consumption quintiles. People in the poorest quintile earn an average of 60,795 rupees annually, while those in the richest quintile earn 3,23,517 rupees, with a significant difference of more than five times.

### 14.3 Working patterns and earnings by occupation groups

Tables 14.3 and 14.4 provide details of individuals' working patterns and earnings by occupation group. The data show significant variations in average working days and earnings across different occupations. Plant and machine operators work the most days annually, averaging 158 days, followed by clerical support workers at 135 days. In contrast, elementary occupations record the lowest average working days at 57 days, followed by skilled agricultural/forestry/fishery workers at 60 days.

Earnings also vary widely across occupation groups. Managers have average annual earnings of 8,21,207 rupees, more than six times the national average of 1,32,625 rupees. Technical and associate profession groups follow closely with average earnings of 3,69,750 rupees. Elementary occupations, on the other hand, earn the least, averaging only 48,642 annually, less than 200 percent of the national average. A similar trend of males working significantly more days than females is consistent across almost all occupation groups.

The earning gap is also significant and persistent in almost all occupations. On average, female clerical support workers work only 66 days, compared to 157.1 days for their male counterparts, earning significantly less.

## 14.4 Working patterns and earnings by rural-urban areas/analytical domains

Table 14.5 highlights a comparative look at working patterns and earnings by urban and rural domains across different provinces. Urban dwellers generally experience longer working days, higher daily wages, and, consequently, higher overall earnings.

Across most provinces, people in urban areas work more days annually than their rural counterparts who work on a short-term basis. For instance, in Koshi province, urban dwellers work an average of 99 days compared to 62 days in rural areas. This trend is consistent in the Madhesh, Bagmati, Gandaki, Lumbini, Karnali, and Sudurpaschim provinces. These differences in work duration translate to a significant earnings gap.

In Kathmandu Valley urban (KVU), the capital city, the annual average earning is 3,45,337 rupees (across short term and long term), significantly higher than the national average of 1,32,625 rupees. Urban areas excluding KVU also show higher average earnings (1,22,246 rupees) than rural areas (76,395 rupees).

### Box 14.1: Summary statistics of wage employment

Description	Nepal Living Standards Survey
	2022/23
Number of daily working days	72
Mean daily wage in cash	599
Mean daily wage in in-kind	77
Mean yearly earning from daily wages (cash and inkind)	54,632
Mean yearly earning from long term job	2,90,682
Mean yearly earning from contractual work	2,15,387
Mean yearly earning	1,32,625
Mode of working condition (percent)	
On daily basis	64.9
On long term (monthly salary) basis	28.7
On contract basis	6.4

# CHAPTER 15: NON-FARM ENTERPRISES

## 15.1 Introduction

NLSS-IV collected information on non-farm or non-agricultural enterprises owned and run by the households. This chapter provides a snapshot of the type of industries, ownership, employees and the income and expenditure of the activities related to these non-farm enterprises.

## 15.2 Distribution of non-farmenterprise by industry

22 percent of the sampled households report having a non-farm enterprise in Nepal in 2022/23. The proportion of non-farm enterprises rises as you move up the consumption quintile from the poorest to the richest and from rural to urban, with the highest proportion in KVVU (Table 15.1). The distribution of the type of enterprises varies across geographical and socioeconomic categories. The overall breakdown is 8.2 percent in agriculture, 22.6 percent in manufacturing, 42.5 percent in trade, 8.2 in transportation and storage, 7.2 percent in accommodation and food services, 11.3 percent in “others.”

Table 15.2 presents the distribution of household enterprises by major sectors of the economy. 8.5 percent are in the primary sector, 24.9 percent in the secondary sector, and 66.5 percent in the tertiary sector. Primary sectors include agriculture, forestry, fishing, mining, and quarrying. Secondary sectors are manufacturing, electricity, gas, steam, and air conditioning; water supply, sewerage, waste management, etc.; and construction. Tertiary sectors include wholesale and retail trade; repair; transportation and storage; accommodation and food service activities; information and communication; financial and insurance activities; real estate activities; professional, scientific and technical; education; human health and social work; arts, entertainment and recreation; other service activities; etc.

## 15.3 Ownership, registration, and hired labour

Enterprises are mostly solely owned by households (95.5 percent), with only 4.5 percent having shared ownership. The registration rate for non-farm enterprises in Nepal was 52.6 percent in 2022/23. KVVU has the highest registration rate, 70.5 percent, much higher than the rural average of 41.6 percent and the urban average of 52.6 percent.

Overall, 17.8 percent of enterprises employ hired labour, but this percentage varies by urban-rural differences and consumption quintiles, with those in the lower consumption quintiles and rural areas hiring much less.

## 15.4 Size of hired workers

Table 15.4 focuses on the number of workers in non-farm activities. Almost half of the non-farm enterprises employ 2 to 9 workers (49.5 percent), with a significant portion using one worker (35.7

percent). Only 14.9 percent of enterprises employ ten or more workers, most of which are concentrated in Bagmati, Koshi, and Madhesh provinces, with Karnali having none. Karnali, however, has the largest proportion of non-farm enterprises with 2-9 workers at 70.6 percent.

## 15.5 Financial Performance

The average gross revenues in nominal terms for non-farm enterprises among sampled households in 2022/23 is Rs. 19,32,121. The survey asks about different types of expenditures, such as salaries, fuel, raw materials, and others, in calculating net revenues. The difference shows that enterprises generally experience positive net earning, but the financial performance varies considerably across regions and socioeconomic groups (Table 15.5).

## 15.6 Operational Tenure

In terms of years of operation, almost 72% of the non-farm enterprises have been in operation for at least 3 years. The rest were relatively new, having been formed in the last two years from the interview date (Table 15.6). The share of non-farm enterprises in the country that have been in operation for at least a decade was notable at 22.6%.

# CHAPTER 16: REMITTANCE AND TRANSFER INCOME

## 16.1 Introduction

NLSS-IV captures remittance as part of transfer income sent or received by households. For this chapter, remittance is a transfer in cash or kind sent or received by a household over the last 12 months preceding the interview. The survey includes information on the flow of remittances in and out of the country.

The percentage of households receiving remittances has increased dramatically from 23.4 percent in 1995/96 to 76.8 percent in 2022/23 (Box 16.1). The jump from the last round in 2010/11 to 2022/23 is 21 percent. Similarly, the nominal average amount of remittance per recipient household rose sharply from NRs. 80,436 in 2010/11 to NRs. 145,093 in 2022/23, an 80.4 percent increase. Internal remittance is also a notable phenomenon, as the share of total remittances received from within Nepal increased in the same period from 19.6 percent to 29.3 percent. Finally, the share of remittances from India also rose from 11.3 percent in 2010/11 to 21.3 percent in 2022/23.

## 16.2 Remittance received by households

In 2022/23, the proportion of households in Nepal receiving remittance income is 76.8 (Table 16.1). The nominal value of an average transfer in receiving households is Rs. 145,093. Per capita nominal remittance when the whole population is considered stands at NRs. 36,273.

Among provinces, Lumbini is leading in the proportion of households receiving remittances (89.6 percent), followed by Karnali at 83.9 percent and Gandaki at 81.1 percent. Gandaki gets the highest average amount of remittance among recipient households at Rs. 215,408, more than twice the amount as Karnali, which receives the lowest at Rs. 95,062. Other provinces with high average receipts are Lumbini at Rs. 178,083 and Koshi at Rs. 155,366.

Remittances are salient in both urban and rural households and the proportion of receiving households in urban regions (excluding Kathmandu Valley urban (68.1 percent) is only slightly lower (77.8 percent) compared to the rural areas (78.4 percent). Within provinces, Lumbini Rural has the highest percentage of households receiving remittances at 93.9 percent, and it also has the highest average number of remittance sources among recipient households at 4.1. The average amount of remittance received among recipient households is highest in Gandaki Urban at Rs. 223,737.

The poor population receives much lower average per capita remittances compared to the non-poor population in the country (Rs. 12,639 compared to 42,282). Among provinces, the difference is stark in Gandaki and Koshi provinces, where there are the largest differences between the average amounts the poor receive compared to the non-poor.

### 16.3 Remittance source (in and outside the country)

A vast majority of remittance flows into Nepal is from outside the country (70.7 percent), with the largest share flowing from India, followed by Qatar and Saudi Arabia (21 percent, 10 percent, and 9.1 percent, respectively) (Table 16.2). Sudurpaschim province has 66.8 percent of remittances coming from India, the highest of any other province, followed by Karnali province (45.1 percent). Malaysia contributes a notable proportion of remittances in Koshi province, at 11.9 percent, close to Qatar at 11.2 percent. The highest proportion for Madhesh comes from Qatar, and for Gandaki, it is UAE. Australia is a notable source country in Bagmati province. Kathmandu Valley urban (KVU) region shows a diverse remittance profile, with a notable 22.8 percent from Australia and 9.9 percent from the United Arab Emirates. Gandaki Urban region demonstrates a relatively high percentage of remittances from Japan, at 5.9 percent, more than other regions.

Migration in Nepal is largely male, which is also evident in the remittance data, where 89.3 percent of remittance senders are males (Table 16.3).

### 16.4 Means of Transferring Remittance

Formal financial institutions are the predominant means of remittance transfer across all categories, with 75.0 percent overall reliance (Table 16.4). This is a sharp departure from NLSS-III, where 77 percent of remittances were transferred by person and 19 percent via financial institutions. Hundi (an informal money transfer mechanism) accounts for only 2 percent of the total. Poor households rely significantly on formal financial institutions at 64.1 percent but use self-transfer methods (17.2 percent). Kathmandu Valley urban (KVU) has the highest use of formal financial institutions at 86.8 percent, showcasing a higher level of financial inclusion and access to banking services. Bagmati Rural regions have the highest percentage of self-transfers at 32.5 percent, substantially higher than other regions. Karnali Urban shows a diverse mix of transfer means, with notable reliance on acquaintances at 1.9 percent and a high percentage of 'Others' at 5.3 percent.

### 16.5 Use of Remittance Received

Remittances continue to play a critical role in meeting the basic needs of a household. Daily consumption dominates use across all sources, with a national average of 72.4 percent. Repaying loans is the next top category (15.8 percent nationally). Remittances from Japan show a high allocation towards loan repayment at 34.0 percent, higher than other countries (Table 16.6). Australia and the United Arab

Emirates also show notable percentages towards loan repayment, with 25.7 percent and 25.1 percent, respectively. South Korea has 15.6 percent of remittances used for education within the country and 6.9 percent for capital formation. Lastly, the United States has the highest percentage of remittances used for daily consumption at 85.9 percent.

# CHAPTER 17: HOUSEHOLD LOANS

## 17.1 Introduction

Credit is an important part of consumption, allowing households to smooth their consumption levels when incomes fluctuate. From immediate consumption of essential food or non-food items to starting or running a business or agriculture, access and use of credit play pivotal roles in determining living standards.

This chapter discusses households that have borrowed loans and the specific characteristics of borrowing. Since 1995/96, the trend in household borrowing in Nepal has fluctuated. From 2010/11 to now, there has been a slight decline in the percentage of households borrowing loans from 65.0% to 63.8% (Box 17.1). The average number of loans per household has remained steady at 1.6, while the use of banks as a source of loans increased from 20.0% to 22.4%. Conversely, reliance on money lenders and relatives has decreased significantly. The purpose of loans has shifted markedly, with loans for 'Other personal use' rising from 43.1% to 55.8%, and loans for business, farm work, and household consumption have declined. Additionally, the proportion of loans secured with land or houses has increased from 12.4% to 17.0%, while those without collateral have decreased.

## 17.2 Households with loans

63.8 percent of households have at least one loan in Nepal as of 2022/23, with an average of 1.6 loans per indebted household. This prevalence is slightly higher among poor households (69.3 percent) compared to non-poor households (62.7 percent) (Table 17.1). The second part of Table 17.1 also shows households that have outstanding loans. An outstanding loan is a financial obligation that has not yet been fully repaid, with the remaining balance still owed to the lender. The incidence of loans among poor households is 6.6 percentage points higher than among non-poor households. The moderate difference is consistent within all provinces. However, among provinces, the incidence is highest in Karnali (74.1) and lowest in Bagmati province (52.4).

## 17.3 Source of loan

Relatives (42.5 percent) are the most common source of loans, followed by banks/financial institutions (22.4 percent) (Table 17.2). Compared to NLSS-III, reliance on relatives has decreased by almost 9 percentage points, but the use of banks or financial institutions has not absorbed all of this, with only a 2-percentage point increase in the latter.

Money lenders still account for a notable portion of loans (11.4 percent), particularly in Madhesh (30.4 percent). Within Madhesh, rural areas rely more on moneylenders than urban ones. Rural regions

generally lag behind urban areas using formal sources such as banks and financial institutions but are not too far behind overall. However, differences within provinces are seen. For example, in Sudurpaschim, rural areas fall behind urban by 11 percentage points in using banks and financial institutions for loans, whereas in Lumbini, it is only 2 percentage points.

### **17.4 Years of borrowing**

A significant portion of loans (45.2 percent) were taken between the Nepali years 2077-2078 (Bikarm Sambat), coinciding with the COVID-19 pandemic (Table 17.3). The following year, 2079-80, also had a high proportion of borrowing at 35.2 percent (the year of the survey).

### **17.5 Purpose of loan**

Most loans are used for 'Other personal use' (apart from household consumption) (55.8 percent) in the country in 2022/23, followed by household consumption (23.5 percent) and business farm use (20.7 percent) (Table 17.4). Bagmati is the top province to borrow for business/farm loans (29.7%) is for business/farm use, followed by Sudurpaschim. However, the average amount of borrowing is much lower in the latter (see Table 17.7 for the average size of borrowing).

### **17.6 Collateral for loan**

A large proportion of loans (64.9 percent) are taken without collateral, rising to 69.6 percent for poor households (Table 17.5). This suggests that informal lending practices are widespread, particularly among vulnerable populations. 'House and land' and 'others' follow at 17 and 15 percent respectively.

### **17.7 Average amount of loan per household and outstanding loan**

The average loan amount per household is Rs. 641,470, but this masks a substantial difference between poor (Rs. 197,040) and non-poor (Rs. 739,800) households (Table 17.7). This gap persists across most provinces and socioeconomic strata. Non-poor households have much higher access to loans as the number of loans in this category is at least 4 times higher than in the poor category. This is true within provinces also.

## Box 17.1: Summary statistics of household loans

# CHAPTER 18: ADEQUACY OF CONSUMPTION

## 18.1 Introduction

The section on adequacy of consumption in NLSS-IV asked respondents to report the degree of adequacy of food, housing, clothing, health care, children’s schooling and total income of the household. Thus, it is based on the subjective judgment of the respondents and the responses are recorded on a three-point scale: “less than adequate”, “just adequate”, and “more than adequate”. “Not applicable” is also an option.

## 18.1 Adequacy of consumption

Tables 18.2 – 18.5 present self-reported data on the adequacy of various consumption categories – housing, clothing, health care, children’s schooling, and income across different regions and socioeconomic groups in Nepal. Across all categories, most respondents reported their consumption to be fair, except in the case of income, where 50.5 percent reported less than adequate. At least 20 percent of the respondents shared their consumption to be less than adequate for all categories except schooling. As expected, the selection of ‘less than adequate’ slides up as one moves the poverty status from richest to poor on the consumption quintiles. The assessment of ‘fair’ slides up in the other direction, moving from poorest to richest. The detailed table shows further disaggregation by provinces, analytical domains, urban/rural, consumption quintiles, and poverty status.

# CHAPTER 19: GOVERNMENT AND PRIVATE FACILITIES

## 19.1 Introduction

This chapter collected information on the opinion of households on a set of important government and private facilities they use. Self-reported quality of various facilities is based on the subjective judgment of the respondents is reported on a four-point scale: “Good”, “Fair”, “Bad” and “Not Applicable”. Those households who do not use these facilities are recorded as “not applicable”.

## 19.2 Government and Private facilities status

Overall, “Fair” ratings dominate across most facilities, suggesting a general perception of average quality (Tables 19.1 – 19.15). However, there are some variations:

- Government Healthcare Facilities: 68.8 percent of respondents rated them “fair”, while only 18.6 percent considered them “good”.
- Private Healthcare Facilities: 57.0 percent rated them “fair”, with a higher proportion (34.6 percent) deeming them “good” compared to government facilities.
- Drinking Water: 32.3 percent rated water quality as “fair”, 18.9 percent reported good and 39.4 percent reporting “not applicable”.
- Roads: The majority (51.2 percent) rated road conditions as “fair”.
- Government Schools: “Fair” ratings dominate (50.1percent), but a higher proportion (14.9 percent) rated them “good”, suggesting a higher level of satisfaction with educational facilities. These numbers are further disaggregated by provinces, analytical domains, consumption quintiles and poverty status in the respective tables.

## CHAPTER 20: SECURITY

### 20.1 Introduction

This chapter incorporated information on security based on the subjective judgment of the respondents. Respondents 10 years and above were asked to report the degree of security they generally felt in their village/city on a five-point scale: “Completely safe”, “Safe”, “Partially safe”, “Insecure”, and “Completely insecure”. This chapter also covers theft and robbery cases, including different types of violence where respondents reported feeling or facing these incidences in the last 12 months.

### 20.2 Security Situation

Tables 20.1 and 20.2 shed light on the security experiences and incidence of various forms of violence across different demographics in Nepal. Table 20.1, focusing on general security perceptions, indicates that a majority of the population (91.9 percent) feels either “Completely safe” or “Safe,” with only a small percentage (0.1 percent) feeling “Completely insecure.” However, there is a gender difference, with females reporting a slightly higher feeling of insecurity compared to males. This trend persists across various geographic regions and poverty levels, though the sense of insecurity is more prevalent in rural areas and among the poor.

Table 20.2 explores the specific experiences of violence across age groups. While the overall incidence of reported violence remains relatively low, there are experiences of “Sexual violence”, which is notably higher among females compared to males. Additionally, females report a higher incidence of “Mental violence” than males. These findings highlight a heightened vulnerability of females to certain types of violence. Furthermore, individuals in the 30-39 age group report the highest incidence of all forms of violence.
